THE COMING INDUSTRIAL FAIR.

The approaching Industrial Fair of the Mechanics' Institute, which will open on the 17th of August next, promises to greatly exceed the last and all preceeding exhibitions of the kind on this coast, both in the magnificence and extent of the display and in the pecuniary results which will accrue therefrom for the benefit of the Institute. At a recent meeting it was decided to award gold and silver medals for articles and inventions of merit, and H. K. Cummings, Charles S. Higgins and Edward Nunan were appointed a committee to report designs and make arrangements for the issue of such medals. We learn from Mr. Pearce, the special agent of the executive committee, that most of the exhibitors at the last Fair have applied for more room than they occupied last year, as they intend to make more extensive displays. Messrs. H. J. Booth & Co., of the Union Foundry, intend to exhibit a splendid engine, of superior excellence and finish, which will be employed as the driving power for the machinery. We shall probably be able to give some further notice of this engine in our next issue. We understand that the demand for space is so pressing that the managers contemplate putting up an additional room, to be employed as a special department for machinery, which will thus be kept quite apart from the balance of the exhibition. This will probably be the last exhibition of the Institute for two or three years to come, as it will be necessary to remove the Pavilion from the public square which it now occupies immediately after the close of the coming Fair; hence all who have new and useful inventions or superior specimens of workmanship to bring to public notice, should embrace the present as the only similar opportunity which will be offered for some years. For further information for exhibitors and others, we refer to the official advertisement of the executive committee, which appears in to-day's issue.

From Richmond.—A copy of the Richmond *Whig*, of April 17th, illustrates, by its advertisements and local items, how quickly every branch of trade commenced reviving upon the re-establishment of United States authority in that rebel-ridden city. As if to begin an entirely new record, the *Whig* headed its new issue with Volume I, and No. 1. Mr. W. W. Hanscom, who presented us with the above mentioned copy, has also received a specimen of "Confederate States" bonds, $1,000 denomination, which appears to have been drawn and printed on stone, by a very weak artist.

Gun Cotton.—Wm. M. Lent, Esq., of this city, has received an invoice of gun cotton, which is said to be twice as powerful, especially for blasting purposes, as gunpowder. Next week Mr. Clary, a resident of this city, and a practical miner, will make an experiment in blasting with this cotton. This new material is alleged to be much cheaper, safer and more effectual for mining purposes than gunpowder; and its introduction is calculated to materially reduce the cost and risk of mining. The cotton produces no smoke in blasting, and one pound of it is equal to six of powder.

Chinese Coming Back.—All the Chinese who have left Virginia City for Idaho, and all who started from California, or any other point, are now on their way back, having been ordered away by the miners of Idaho and Montana, who will allow no Chinese in the mines. There were recently about three hundred Celestials camped at the Sink of the Humboldt on their way back.

WASHOE.

The miaes still continue to tara out their fall average of the precious metals, and no lack of confidence in the future is noticed amoug mining men. Duriag the two first weeks of the prceat montb $584,322 wortb of bullion was shipped by Wells, Fargo & Co., from Virginia City, and $121,604 from Gold Hill. According to the *News*, there are now in Gold Hill fiftcen ballion-producing mines—the lowest product of aay one of them, within the last three months, was $19,000; and the largest product of another was $722,000. Virginia Mining District has six bullion-producing mines—tbe largest product of any one of them, within three months, was between two aad three hundred thousand dollars.

The Bonner shaft ot the Gould & Curry miae is paying finely, and will reacb its proposed depth of 1,000 feet by the 1st of January next.

Three or four new mills are to be erected in Churchill county, at La Plata and Alpine, the coming season.

The Tarsbish Silver Miniag Company, of Ione district, Lyon county, has beeu sold to New York capitalists for $1,200,000.

The Montgomery Company, Palmyra district, have struck tbeir ledge, 200 feet deep, and found promising ore. The Ward claim also has got fine sulphuret ore.

In Nye county eight new mills are now being built, the smallest of which will run twenty stamps, aad the largest thirty. The capital employed ia building them is mostly from the East. The prospects of Nye county are decidedly flattering. Mail facilities are also being more fully extended ia that direction.

Let it be Known.—When aay of our readors respond (by letters of inquiry or by tho purchaso of artieles) to advertisemonts found in our columns, thoy will confer a favor, not ouly upon us, but upon the advertiser, by mentioning the fact of having seen the notice in our paper

Ironclads.—Dr. Holden, of Newark, N. J., formerly of the United States medical service, at a recent meeting of the Essex Medical Union, read an interesting paper on a peculiar disease which has appeared on board our ironclads. The disease, which was denominated "Ironclad Fever," for the want of a name, never occurred anywhere else, or at least has never been before made the subject of report or record. It made its appearance soon after the first ironclads were anchored in Southern harbors. It was very fatal; only about one-eighth of those attacked recovered. The earliest or prominent symptoms were the entire loss of voice, with pain in the head, neck and spine. Dissection proved that an important spinal nerve was the subject of disease. Great prostration was evident among those who were exposed, but were not the subjects of attack. Cases not too far advanced recovered when taken ashore. The disease wholly ceased when certain important improvements were introduced, accomplishing more perfect ventilation, and the water-tanks were lined. Dr. Holden attributes the disease to the influence of the iron surroundiags, and the use of the water, so impregnnted with iron-rust as to be of a dark red color and thick consisteace; also to the want of ventilation, which was probably the real cause. When more efficient means were adopted to force air into the cabins by the use of the engiae-blowers, the disease was no loager observed.

To Correspondents.—The Age of Gold-Bearing Rocks, No. 4, will appear aext week; also, The Problem of Gold and Silver Extraction, No. 11. We have on file another interesting letter from Prof. Brewer, descriptive of the Museum of Comparative Zoology at Cambridge, Mass.

Lost and Found.—One of the Pioneer stages lost two sacks of bullion, a few days since, between Gold Hill and Carsoa. The bars were found in the road just below the Mound House, one by tbe stage, the other by a man on horseback, and promptly handed over to the proper parties.

[Written for the Mining and Scientific Press.]

Petroleum--What Are We Waiting For?

Messrs. Editors:—It seems to be pretty extensively believed, nnd tbe facts warrant that belief, that the indications alrendy discovered and mads known of the existence of inexhnnstible quantities of petroleum in the Coast Rnnge and adjacent plains nre of sufficient mngnitade to encourage the grandest expectations of sudden wealth in tho minds of our excitable, energetic and never-to-be-discouraged people. And yet the cronkers have for a time succeeded in retarding the development of this magnificent interest by various modes, such as dispnraging and discrediting the facts already ascertained, nnd advancing absurd theories to account for or contradict these facts. The self-constituted leading journals have taken great pains to *mis*-lead their readers, particularly as to the facts, and to throw doubt nnd ridicule upon them. I do not propose to run a tilt with them upon this score or any other in the present article, but only to endeavor to awaken the slumbering energies of our hitherto persevering and obstucle-conqaering population, and induce many wbo are "waiting for sometbing to turn up" in the line of petroleum to go out and turn something up for themselves.

The general idea seems to be that if only *one* "flowing well" could be struck it would then be all right with the petroleum interest throughout the State, whereas the very reverse would be the case; for the opening of one well ia a single locality could by no possibility benefit nny otber locality to the extent now imagined. As in Pennsylvania, we should find that the existence of oil in "flowing" quantities in one place is no proof of its existence in the same quantities in another, and more especially a remote place. Instead of being an inducement to bore in localities at any and every distance from the scene of the first discovery, it could only cause a "rush" for the immediate neighborhood of the first "flowing well." And as for the stock of companies organized for the purpose of speculating apon a rise in the value of that description of property as soon as the first flowing well is struck, it could only appreciate in proportion to the approximation of the oil lands belonging to sucb compaaies to the scene of such well.

The query at the head of this article, therefore, is one pertinent to the present condition of the petroleaa interest on this coast. Thousands of acres have been located, pre-empted, leased and purchased, and many companies organized and incorporated, with nu astonishing nnmber of millions of dollars capital, to say nothing of private enterprises, whicb have accomplished no more thaa location of ground for the same purpose; und yet but few of all these parties are doing anything to prove the wealth of their laads, the rest seeming content to wait till somebody has struck n flowing well before trying to strike one themselves.

Now this is all wrong, and is but a continuance of the policy that has ruined hundreds of good mining localities everywhere on the Pacific slope. This Micawber-like waiting for somebody else to do something before anything is attempted by ourselves, is the characteristic of those wbo wish to speculate upon the labor of otbers, and will not lend a hand to raise their own share of tbe burden. All this sort of people will find themselves a long way ia the backgrounnd when somethiag has really been accomplished by others more energetic and more faithful.

It is no more expeasive to bore for oil than it is to bore for water, and we see what private enterprise has done in this line in the valley of Santa Clara and elsewhere in this State, with entire success. Maay seem to think it necessary that there should be unwieldy corporations organized, and immense capital invested, before the auger is started on its downward course; but the absurdity of this becomes manifest wben one reflects that in some places in tbis State the oil can even now be collected at the surface at the rate of five barrels a day without diminishing the flow. At five dollars per barrel, this is a pretty little capital wherewith to work other portions of the same land by boring to a great depth. Why, then, do not those wbo are boasting of having possession of valuable oil lands, either in fee simple or leasehold, go to work upon them immediately and prove their value to the world? The truth is, they are holdiag on for big offers from New York and Peunsylvania capitalists when the *first* "flowing well" is struck *somewhere* on this coast.

But the Eastern speculators have long since cat their eye-teeth. They ure not going to invest nt random in every piece of land showing indicutions of petroleum. They will first ascertain how much work has been done to test the value of the land as an oil-producing region, and how nenr or far it may be from other localities where oil has been alrendy struck in paying quantities.

In all the petroleum lands of Pennsylvanin, Ohio, Indiana and Virginia, we find the owners thomselves first going to work and demonstrating that oil can be profitably obtained on their property before offering it in the market; and in some cases the proprietors have refused to sell, preferring to be themselves interested in the immense profits of working their own land nnd disposing of the product. Why cannot their example be imitated to advantage by the thousand and one individual land owners in this State who nre each now waiting for somebody else to turn up something for the whole? One would think that the fact that the first flowing well will immediately cause the land in its vicinity to appreciate in value a thousand fold, would stimulate the capidity of these people up to an active working pitch, and induce them to endeavor to produce the first well upon their own property.

Nothing can be more certain than that this waiting policy does and will operate to the detriment of the petrolenm interest in this State—the waiters themselves being made as great sufferers by it as any. Let every one, therefore, who has any landed interest, in fee or otherwise, upon whose property exist unmistakable indications of oil, start the auger immediately, and bore away into the rocky ribs of earth instead of boring the brokers and speculators of Montgomery and Wall street by auguries of immense fortunes to be realized by simply purchasing a piece of land where oil may be found, but upon which no *working* man has ever set his foot.

To do this requires but little capital, and every foot of tubing may be considered as more than paid for by the increasing value of every foot of land upon which thorough work is performed. At the same time, every foot in depth is so much nearer a practical realization of the truth or fallacy of the indications exhibited on the surface. We cannot conceive, however, of the probability of obtaining no valuable results where the indications first seen are of an unmistakable character, and are found in abundance.

Too much cannot be said, Messrs. Editors, to induce all interested to change their present do-nothing policy. With your permission, I may have more to say on this subject by-and-by.

W. H. Manning.

After talking half an hour with a man of a jerky miad, it is a great relief to talk with a dull friend. It is like taking the cat in you lap after holding the squirrel.

PETROLEUM OIL WELLS.

THE HAMMER QUARTZ MILL.

[PATENT APPLIED FOR.]

This Machine is now complete and ready for sale. In constructing it, our aim has been to produce a light, cheap and economical Crusher—one adapted to mining on a small as well as on a large scale.

The elementary principle on which it operates is that of the stamp—the only one really reliable and economical.

But the stamp has many serious disadvantages, among which are its great weight and small velocity; the great power required to run it; difficulty in feeding properly; imperfect discharge, and the necessity of crushing wet, or the annoyance from dust in crushing dry.

All these difficulties are obviated in our machine, and the percussive blow of the stamp retained, with the further advantage of its being a drawing or grinding one.

We give to our hammers such absolute or relative weight and velocity as we choose—just such as to effect their purpose and no more—thus securing the qualities of the natural hammer blow.

The feed is self-adjusting and uniform, and as fast as the ore reaches the required degree of fineness (which depends upon the fineness of the screen or sieve used), it is instantly discharged, so that there is no packing of the ore under the hammers.

The mill crushes dry, with no more dust than that incident to feeding, which is trifling.

As the only support of the mortar is a single post set into the ground, the machine can be put in place at slight expense.

The size now being built weighs about 1,800 pounds complete; the heaviest piece not weighing over 275 pounds. It is driven by half a horse-power, and crushes from three to ten tons per day of twenty-four hours per day, according to the character of the rock and the fineness to which it is reduced.

PRICE,.....$800.

Larger ones will be furnished if desired.

We invite an inspection of the Mill now in operation adjoining the Foundry of DEVOE, DINSMORE & CO., on Fremont street, between Market and Mission, San Francisco.

Office, No. 11 Court Block, San Francisco, Cal.

21v10 RIX & LOGAN.

WASHOE COAL.—R. D. Ferguson, formerly of Sacramento, has shown the Virginia *Union* a sample of coal from the Crystal Peak mine, of which that paper speaks in the following terms:

"This recent seam of coal was struck on the claim of the aforesaid company in a shaft sunk on coal croppings to the depth of twenty-one feet, at which point the seam is twenty-two inches in width. In appearance this coal is of a jet black enamel color, closely formed, without taste or smell, yet burning freely, producing a welding heat in a remarkably short space of time, and as by a recent trial by the Gas Company, producing a fraction over eight thousand cubic feet of excellent gas to the ton, and containing little or no sulphur."

STRANGE ACCIDENT.—L. Perkins, a farmer, who was shearing sheep recently, says the Oregon *Arena*, met with a severe accident. He had a habit of carrying his tongue between his teeth while at work. In catching a sheep, it threw up its head and struck his chin, causing his teeth to close on his tongue, and severed it, except about a half or three-quarters of an inch. It was sewed together by one of the men present, and is doing very well.

A gentleman from Georgia says there are a million and a half bales of cotton in Georgia, and a million of bales in Alabama. There is a large quantity buried in the sand. He says cotton can be purchased for 10 cents a pound in Savannah as soon as Government restrictions on trade are removed.

THE South made war for the sake of her negroes and has lost them. Seldom have we known so striking an exemplification of the saying about going for "wool" and coming home shorn.

THE BEST BOOK

—FOR—

MINERS, PROSPECTORS AND MILLMEN.

Nevada & California Processes

—OF—

SILVER AND GOLD

EXTRACTION,

For General Use,

BY GIUDO KÜSTEL,

Mining Engineer and Metallurgist—Formerly of the Ophir Works,

IN ONE HANDSOME OCTAVO VOLUME.

SYNOPSIS OF THE WORK.

PART FIRST.

Chapter 1st—Treats of the methods of recognizing silver and gold ores, and contains a "Systematic Proceeding" for their determination by blowpipe analysis readily learned and practised, and is a reliable and accurate guide.

Chapter 2d—Is a description of gold and silver ores, describing many interesting occurrences in minerals belonging to the Comstock, Gold Hill, Humboldt, and Arizona Mining Districts.

Chapter 3d—Describes the requisites and approved methods for testing and assaying—with Illustrations.

Chapter 4th—Speaks chiefly of the extraction of gold, especially the amalgamation treatment of ores in batteries, pans and arrastras; and also the extraction of gold by chlorination.

Chapter 5th—Is replete with valuable information on the extraction of silver, including divisions of processes employed. The behavior of chemicals by the wet process; the same when calcined—with valuable hints to attendants roasting ores. Full description for the cold and melting processes, etc.

Chapter 6th—Makes mention of the most modern utensils and machinery, such as pans, agitators, furnaces, etc., with comprehensive diagrams.

PART SECOND.

ON GENERAL METALLURGY.

Chapter 1st—Treats of many species of argentiferous ores; the dry assays of rich and poor ores; also, the same by the humid and dry methods.

Chapter 2d—Presents a clear and comprehensive description of the extraction of silver either by melting or amalgamating process—its dissolution and final precipitation—with divisions of the principal modes of extraction employed.

Chapter 3d—This last chapter gives full and precise formulas for the extraction of the metals in the dry way; the various modes employed in Europe and South America.

The "Amalgamation in pans" with chemicals, or dry method by calcination or roasting ores, forms the most valuable portion of the work; the same being thoroughly and distinctly described and explained, and particularly designed for the treatment of ores in Lower California, Arizona, Mexico, and other mining districts where argentiferous lead ores abound. No less valuable and important are the practical descriptions and illustrations of cupellation and refining of silver, and concentration of the same in lead, by the Pattinson and other processes.

This Work is invaluable to Prospectors, Miners, Metallurgists and Mill-men through out the Pacific States, containing valuable formulas for the treatment of ores and minerals, expressly prepared in an authentic manner and in plainly written style, for persons engaged in mills in California, Washoe, Lower California, etc. It is also valuable to prospectors and miners unacquainted with mineralogy, having a full and clear chapter on Blowpipe Assays and Tests.

EUROPEAN

METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "refractious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

OIL IN KENTUCKY.—Good reports of the oil fertility of Kentucky are in circulation. One paper says that the territory embraced within the counties of Meade, Hardin, Grayson and Breckinridge, is rich beyond precedent, and the soil, extending through the whole of ravines therein, cannot be surpassed, if equalled, in quality, for oil operations. In the vicinity of Brandenburg, on the Ohio river, taking in a circle of ten miles, the land is full of oil. The wells may be almost said to be on the surface, some of them, exceeding one hundred yards in depth, and some not thirty feet, so that but little outlay of capital for development is needed while the prospect of fruitful returns is large.

THE NATION'S CAPITOL.—Workmen are engaged in putting the finishing touches to the iron work of the immense dome of the Capitol. The only part remaining to be done is that where the steam engine was placed to haul up the material for construction. In a very few days the great dome—the wonder of modern engineering—will be finished, just about as rebellion and civil war on a grand scale are coming to an end in the land.

A COTTON FIELD IN CALAVERAS.—General D. F. Douglass, formerly United States Marshal and Secretary of State under the old Democratic and Know Nothing rules, has twelve acres of cotton under cultivation on the Calaveras and on the stage road from Stockton to Mokelumne Hill. The seed was planted in the latter part of April.

UNASSESSABLE.

First National

PETROLEUM COMPANY.

Organized under the Laws of the State of California, March, 1865.

CAPITAL STOCK,....$1,000,000,

Divided into 200,000 Shares of $5 Each.

OFFICERS:

HON. J. E. VINTON.....President.
A. W. STRATTON.....Treasurer.
D. S. CUTTER.....Secretary.

TRUSTEES:

J. E. VINTON, W. H. TOBEY, A. W. STRATTON,
W. B. EWER, M. C. CONROY.

Office: At W. H. Tobey & Co.'s Petroleum Agency,
Room No. 20 Government House,
SAN FRANCISCO.

This Company issues none but UNASSESSABLE STOCK. This Company's ground is developed by a special fund, derived from sales from a reserved amount of stock set apart by the Company for such a purpose

This Company has secured SIX HUNDRED AND FORTY ACRES OF LAND, in Tulare county, California, in the midst of one of the most valuable oil regions on the continent. One of the largest flowing oil springs in the State is located upon the ground, over a large extent of which oil may be found by sinking open shafts to the depth of ten or fifteen feet.

The lands were selected by the same parties who assisted in locating the well known "Buena Vista Petroleum Company," which company it adjoins on the south.

One hundred gallons of crude oil have already been received in this city from the Buena Vista Company, upon whose grounds a flowing well has been struck at a depth of fifty feet. This oil may be seen at the laboratory of Prof. E. Benoist, at 643 Third street, San Francisco. From it has been distilled as pure an article of kerosene as can be found in the city, samples of which can be seen at the office of the "FIRST NATIONAL PETROLEUM COMPANY," Room No. 20 Government House, in this city.

DEVELOPMENT.

The Company has already entered into a contract with parties who will start the coming week with suitable tools for developing the property. The Company rests its claim to confidence solely upon the intrinsic value of its property, and feels the utmost assurance that its development will realize their most sanguine expectations, and enable it to take rank, at an early day, as a dividend-paying concern.

We would again call the attention of the public to the fact that when you have purchased stock in this Company there can be no assessments coming upon you—that no "freezing out" can be attempted by large stockholders upon smaller ones.

THE CONTINGENT FUND,

From which all expenses are paid, is derived from sales of a reserved fund of ten thousand shares of unassessable stock, whose par value is $50,000. The prospectus and map of the Company's location can be had on application to the Secretary, at his office, Government House, corner Sansome and Washington streets, San Francisco.

Only two thousand shares of the contingent fund is now the only stock in the market for sale, and the proceeds derived therefrom will be appropriated for the purpose designed. The Company are sanguine that they will be able to produce oil in this market from a flowing well upon their claim inside of six weeks, upon which accomplishment there is every reason to believe that the stock will be worth its par value.

San Francisco, April 7, 1865. 14v10

A MAN named Knox, of the quicksilver mines in Lake county, Cal., says the Clear Lake *Times*, struck oil a short time ago under rather singular circumstances, and when he least expected it. Knox was sinking a shaft not far from the old tunnel, and went down one hundred and twenty feet without even the appearance of water, and while the workmen were gone for dinner, water bursted up the bottom and filled it to the depth of twenty feet in a few minutes. A quantity of dirt was thrown back, but the water continued until it had come within twenty feet of the top, and from the top of this water was taken five gallons of pure petroleum. Knox said he was after quicksilver and did not want oil.

A GUN WORTH SHOOTING WITH—Lieutenant-Governor Bross, of Illinois, now on his way to California, writes to a friend in this city that he has recently purchased a double-barrelled laminated steel gun of George T. Anbey, of Chicago, said to be the finest ever seen in America, for $535. Such a gun *ought* to "shoot like lightning" if the holder expects to get the worth of his money.

"Say, why should man for thirst be given
If not for wine bestowed by Heaven
To quench such drought as mine?
Without it, I'm a fish on land,
A barren heap of parching sand—
Then give me joyous wine."—*Trinklied.*

Delicacy of flavor, exhilaration without intoxication, and every other desirable property belonging to the richly fermented Juice of the Grape, are to be found in the "Gerke Wine," from the celebrated Bosquejo Vineyard, Tehama county.

There is no wine produced in California that can bear comparison with this, and it would be difficult to find a European wine, of the same class, that can surpass it.

The vintage of 1862 is now offered for sale, in quantities to suit, by the Agent of the vineyard,

A. S. LOWNDES,

Basement of the New York Hotel, southwest corner Battery and Commercial streets, San Francisco. 20v10-qy

A Full Assortment of DRUGGISTS' GLASSWARE and DRUGGISTS' SUNDRIES, ACIDS and CHEMICALS, constantly on hand.

San Francisco, March 16, 1865. 11v10-tf

Machinery.

A CARD.

MR. H. S. JACOBS, formerly of this State and Oregon, adopts this method of calling the attention of his old friends and customers to the fact that he has established himself permanently in the city of New York, having since his residence in California, perfected and secured by letters patent his celebrated WHEEL-MAKING MACHINERY, which not only materially reduces the cost of manufacture, but makes a much more durable and finished wheel than by the old method. These facts are simply attested by the large and increasing demand for Wheels made by this machinery, as well as by the numerous testimonials furnished by parties who have purchased and tested them. Having made large contracts for timber, selected expressly for this purpose by a gentleman who has had an experience of upwards of thirty-five years, and whose entire attention is devoted to the selection of stock connected with this branch of industry, and having had myself an experience of eleven years in manufacturing in California and Oregon, and being personally acquainted with the sizes, styles, manufacturing and wants of these States, I feel the most entire confidence in being able to supply the trade with a better and cheaper article than can be had from any other source, and in whatever quantity may be desired, having on hand at present one of the largest and best assorted stocks of Omnibus, Truck, Cart and Light Wagon Wheels, of all sizes, together with a varied assortment of Hubs, Spokes, Felloes, Bent Rims, Shafts, Poles, etc., to be found in the country—all made under my own supervision and of the very best material and workmanship. All descriptions of well-seasoned Timber kept constantly on hand and supplied in any quantity. Orders for material of all and every kind pertaining to Wagon manufacture will be filled promptly for cash on delivery.

Address, THE JACOBS PATENT WHEEL-DRESSING MACHINE AND WHEEL COMPANY, 99 Wall street and 145 and 147 Bank street, New York.

N. B.—Those desiring peculiarity of style in Hubs, Felloes, Spokes, etc., can be accommodated, and will receive our careful attention by sending samples of the same. [20v10

PRESCOTT & SCHEIDEL,

Marysville Foundry.

March 31st, 1865. 13v10-3m

SALMON'S

PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this amalgamator, and assayed by Miller & Limbaum, at Austin, Nevada:

No.	Fine		No.	Fine
Assay	250	Assay	300	990
Assay	285	Assay for Czotman		980
Assay	286	Assay Water Rock		966
Assay	291	950 Assay Water Rock		998
Assay		St. Helena Ledge, W. D.		906

These, including a hundred other batches, were all worked to within fifteen per cent., and some to within ten per cent., of the assay. Parties interested will find it to their advantage to call and see the above machine in operation.

Manufactured at the San Francisco Foundry, San Francisco, California, by

J. & W. C. SALMON,

To whom all orders should be addressed. 15

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,

At the Novelty Iron Works, Nos. 37 & 39 Fremont street. 15-1m

BAUX & GUIOD'S

Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Scientific Knowledge with Practical Experience, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

Lapidaries' refuse, Refiners' ashes, Jewelers' sweepings, purchased or worked for a percentage. Ores and tailings worked or assayed at reasonable rates.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8

FARRAND'S

Oscillating Amalgamator,

RECEIVED THE

ONLY PREMIUM

AWARDED FOR AMALGAMATORS

At the Recent Industrial Fair

OF THE

Mechanics' Institute of San Francisco.

Committee of Awards.

O. BELDEN,	W. T. GARRATT,	H. P. WAKELEE,
O. GORI,	GEO. JOHNSON,	C. M. RADCLIFF.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall, and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, while the loss by trituration is comparatively nothing.

4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.

5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY.

W. D. FARRAND, Inventor,

R. L. OGDEN, Agent, SAN FRANCISCO.

S. E. corner Montgomery and California streets. 19v9

HANSCOM'S CRUSHERS,

Made in sizes suitable for Breaking Quartz for Batteries; Rock for macadamizing or concrete; Copper Ore for sacking, sampling, or concentrating; also, for crushing Quartz for Arastras and Grinders. The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water, or Steam Power. For further information address W. W. HANSCOM.

I Golden State Iron Works, San Francisco.

HUNT'S PATENT

Circular Sweep Horse-Powers,

For running Churns, Washing Machines, Grindstones, pumping water, sawing wood, and other light machinery. Price, $100, at the Factory.

HUNT'S PATENT SELF-REGULATING TREAD HORSE-POWER is superior to any machine of the kind in the market. Price, with Governor, all complete to set to work, at the Factory, $300. Manufactured by

E. O. HUNT.

17v10 28 Second street, San Francisco.

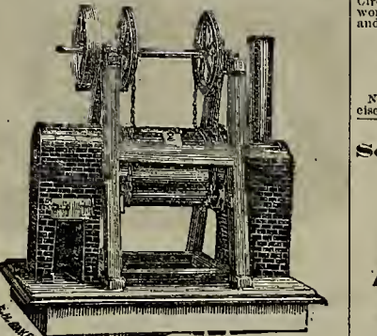
NOTICE TO MINERS.

NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.



F. GENARD, **B. FAUCHERY,**

Metallurgist. **Engineer,**

24v9

WM. BRUCKNER'S

Furnace for Roasting Ores.

Now in Operation at 416 Market street.

This Furnace, which is portable, and can be carried on muleback, undertakes to roast without employing any labor whatever for the operation of stirring, which is accomplished by machinery that may be driven by steam or any other motor. It consists of an iron cylinder, which, being suspended by chains, in rotating mixes and stirs the ore, by an internal apparatus, quicker and more perfectly than can be done in any other furnace hitherto known in metallurgy. It can be applied to any kind of ore, and the rapidity and perfectedness of its operation, the great saving in fuel, and the entire saving of the labor usually required for stirring the ore, together with the small cost of constructing it, renders this furnace a most

Economical and Practical Invention.

The Furnace may be had of two sizes—one being nine feet in length and holding fourteen hundred pounds, and the other six feet in length, and holding eight hundred pounds. One horse power is required to drive the machinery of the larger sized furnace, and three-fourths of a horse-power for the smaller size. Parties wishing to erect such furnaces will please communicate to

W. BRUCKNER,

5v10 No. 416 Market street, San Francisco.

BLAKE'S

QUARTZ BREAKER

Is now extensively used for breaking hard masses of

Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

CALIFORNIA, AUSTRALIA,
WASHOE,
ENGLAND, FRANCE,
— AND —
THE ATLANTIC STATES.

These Machines, or circulars containing further information regarding them, may be obtained of the undersigned. Address,

BLAKE & TYLER,

Box 2077 San Francisco Post Office.

CHAS. T. BLAKE, Idaho City. E. TYLER, Michigan Bluff. WM. P. BLAKE, San Francisco.

4v10

VARNEY'S

PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v10 San Francisco.

Hepburn & Peterson's

AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant st. bet. 3d and 4th. [Illustrated in the Mining and Scientific Press, April 9th, 1864.] HEPBURN & PETERSON.

HUNT'S

IMPROVED WIND-MILL.

THIS WIND MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order, they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

HORSE POWER

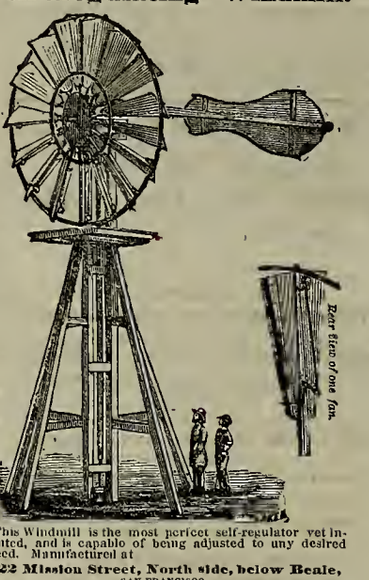
For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.



☞ For further Particulars see small circulars. ☜

E. O. HUNT,

No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

ATWOOD'S

Self-Regulating Windmill.

Exact Size of one fan.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,

SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5-

HENDY'S

IMPROVED BLOW-PIPE.

This Convenient Helpmeet

— TO THE —

ASSAYER, CHEMIST, DENTIST, JEWELLER, PROSPECTOR AND MILLMAN,

Can now be procured, at the Patentee's price, by sending your orders, by mail or otherwise, to the

Office of the Mining and Scientific Press.

This article was more fully mentioned in the PRESS of April 15th, 1865. Since that time, however, Mr. Hendy has made a further improvement by attaching a rubber hose between the mouth-piece and the pipe, enabling the blower to change his position without disturbing the direction or constant accuracy of the current on the object upon which it is turned. The main portion of the blow-pipe is made with a joint, at which a valve is placed, which is opened when the operator blows and closed immediately when he ceases. By this arrangement the little bag or bladder is readily filled at a single breath, and with very little exertion. When so filled, a continuous current of air is forced from the nozzle of the pipe by the mere contractive force of the gutta percha. This force is uniform until the air is very nearly exhausted. The current may be easily varied or entirely cut off by gently pressing the fingers upon the neck of the bladder above the nipple to which it is attached.

Price, Complete.....$5.00.

CALL AND EXAMINE SAMPLES.

Sent by mail, if desired. Address

And in accordance with law, and an order of the Board of Trustees, made on the 8th day of May, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at public auction, by Maurice Dore & Co., No. 327 Montgomery street, San Francisco, on Monday, the 19th day of June, 1865, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

W. W. KNIGHT, Secretary.

Office, 38 Exchange Building, corner Washington and Montgomery streets, San Francisco. my27

El Alamo de San Antonio Mining Company,
San Antonio Mining District, Lower California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held December 6th, 1864, an assessment of one ($1) dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, 514 Bush street, San Francisco. Assessments paid on or before the 20th instant, ten per cent. will be allowed on the amount so paid.

Any stock upon which said assessment shall remain unpaid on Tuesday, the 3d day of January, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Tuesday, the 17th day of January, 1865, to pay the delinquent Assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

THOMAS RUTHERFORD, Secretary.

SUPPLEMENTARY NOTICE.—In consequence of an omission to advertise the delinquent stock on the above assessment on the day set forth—namely, the 3d day of January, 1865—the said assessment is hereby re-published, as by law provided; and in accordance therewith, any stock upon which said assessment shall remain due and unpaid on Saturday, July 1st, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, July 15th, 1865, to pay said delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

THOMAS RUTHERFORD, Secretary.

San Francisco, May 27, 1865. my27-td

Garcia Petroleum Oil Company, Garcia District, Mendocino County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 22d day of May, 1865, an assessment of fifty cents per share was levied upon the assessable stock of said company, payable on the 23d day of May, 1865, in United States gold coin, to the Secretary, D. S. CUTTER, at Room 28, Government House, San Francisco.

Any Stock upon which said assessment shall remain unpaid on Saturday, the 24th day of June, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 8th day of July, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

D. S. CUTTER, Secretary.

Office, Room 28, Government House, corner Washington and Sansome streets, San Francisco. my27

Jewett Gold and Silver Mining Company
Works located at Gold Hill, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 22d day of May, 1865, an assessment of one dollar per share was levied upon the assessable capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 509 Clay street, in the city and county of San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 24th day of June, 1865, will be advertised on that day as delinquent, and unless payment shall have been made before, will be sold on Saturday, the 10th day of July, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

A. M. COMSTOCK, Secretary

Office, No. 509 Clay street, City and County of San Francisco, California. my27

Mammoth Gold and Silver Mining Company,
Rock Spring District, San Bernardino County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 20th day of May, 1865, an assessment of fifty cents per share was levied the capital stock of said company, payable on the 22d day of May, 1865, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 611 Clay street (Room No. 8), San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 24th day of June, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 10th of July, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

W. L. KIRBY, Secretary.

Office, 611 Clay street, San Francisco. my27

Mountain Mary Gold and Silver Mining Company, Silver Mountain District, Alpine County, California.
Assessment No. 2.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 22d day of May, 1865, an assessment of fifty cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on Saturday, the 24th day of June, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 10th day of July, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

W. D. ROOT, Secretary.

NOTICE.—At the above meeting, Assessment No. 1, levied April 23d, 1864, was rescinded, and stockholders having paid said assessment will be credited on Assessment No. 2 accordingly. W. D. ROOT, Secretary.

Office, 410 Montgomery street, San Francisco. my27

McComb, Esq., Government House; M. Flood, Esq., 423 Kearny street, and three hundred others. 21v10

TERRIBLE ACCIDENT.—A terrible accident occurred to Mr Meda, superintendent of the Succor mill, Silver City, Nevada, a few days since. While working in one of the pans in the amalgamating room, over which a car tract passes, he was caught in the machinery and so seriously injured that his life is despaired of. It appears that while he was working in the pan the machinery was set in motion by some mistake, without the knowledge of the unfortunate man. He was caught by the mullers, drawn under the car track, and terribly crushed and bruised. He has a wife and one child living near the mill.

HIGH WAGES EAST.—The Cleveland *Plaindealer* says all the iron manufactures of Pittsburg have suspended operations. All of them stopped a short time ago except two, one of which was engaged on Goverument work, and the other on the agricultural implements, working up for that purpose an extra quantity of iron. These latter have also stopped. The cause of this unfortunate state of things is the high price of labor and stock, in comparison with the price of manufactured iron. The current rate of wages for a puddler, for example, was $6 per pay.

DIVIDEND.—The Eureka Gold Mining Company declares a dividend of four dollars and a half per share on the capital stock, payable at the office of the Company in this city.

A lamp has been invented in London that requires no chimney nor winding up, the wick does not need renewing or cutting more than once in three months.

A PELVIS bone of an extinct animal, allied in structure and size to the elephant, was a few days since dug from a bed of gravel eight or ten miles east of Dalles. This is thought to be the first discovery of the kind in eastern Oregon.

Thirteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

Liberal Terms to Clubs.

THE GOLDEN ERA is furnished to CLUBS at the following rates: Three Copies, one year, Ten Dollars; Five Copies, one year, Fifteen Dollars; Ten Copies, one year, Twenty five Dollars. An extra copy will be forwarded, free, for one year, to the person sending a club of five or ten subscribers.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

IN THE GOLDEN ERA,

"THE FAIR LILIAS;"

Or, "LIFE IN DEATH,"

A New Story, by PIERCE EGAN, Author of "The Poor Girl," "The Flower of the Flock," "Lady Maud," "The Snake in the Grass," "Such is Life," Etc.

PIERCE EGAN is undoubtedly the most fascinating and attractive Novelist of the age. His stories are eagerly sought for, read and admired by hundreds of thousands in England and America. "THE FAIR LILIAS; or, Life in Death," surpasses, in exciting interest and thrilling situations, all of the productions of the celebrated author, and is Pierce Egan's masterpiece.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

CALIFORNIA

HERMETICALLY SEALED BARRELS,

—FOR—

TRANSPORTING CRUDE PETROLEUM, KEROSENE, AND OTHER VOLATILE OILS.

WM. H. TOBEY & CO., having purchased the sole right of the United States and Territories to make and vend the above Barrels for the period of ten years, we are now prepared to enter into contracts with parties desirous of using such Barrels, to furnish the same, in any quantity, and at short notice. Samples may be seen at the office of Wm. H. Tobey & Co., Petroleum Agency, Room 20, Government House, San Francisco.

The above invention consists of a simple but effective preparation, which can be applied as a coating to any ordinary barrel of pine or hard wood, by which the same is rendered perfectly impervious to the most volatile substance known, thus rendering an ordinary barrel quite as safe a receptacle for Petroleum as a metal case, and at far less cost. Orders received as above by

TO OWNERS OF MINES,

As many mines are being offered in the New York market, and as experience has proved that not one in ten of the titles are in proper form, we will state that the following is considered a good title:—

1. Copy of Notice of Location certified to by Recorder of District.

2. Certificate of Notary that A. B. is Recorder of District.

3. Deed of Power of Attorney from Locators to party selling, which deed or power of attorney must be recorded in the county in which the property is located.

4. Certificate from County Clerk that Notary and County Recorder is duly qualified.

C. A. CRANE,

9v10-1m No. 4 Cedar street, New York.

TO MINE OWNERS.

REDUCTION AND SMELTING WORKS ON A SUFFICIENTLY large scale, where Ores of every kind can be thoroughly treated, so as to extract therefrom the precious metals, have long been wanted in California.

The Undersigned is desirous of erecting such works to meet the demand, provided sufficient encouragement can be obtained in regard to the quantity of work which may reasonably be looked for.

I have sufficiently proven, in my former smelting works, on Bryant Street, where I worked the richest of the Ophir ores to within Two and One-Half per cent. of the Assay, that I was acquainted with Metallurgy previous to my recent travels and experience in Europe, where I have built, during my sojourn there of nearly three years, many Reduction Works, thereby proving that I am capable of working ores by any and all known processes, whether by Smelting or Amalgamating, or other methods best adapted to the nature of the ore to be worked, and as close to the assay as can be done anywhere in Europe.

Mine owners wishing quantities worked as cheaply and effectively as can be done by sending it to Europe, will address the undersigned. Parties wishing to erect Quartz Mills, or other Reduction Works, can be furnished with Plans, Estimations, and other useful and necessary information as to the best mode of extracting the precious metals.

Address J. MOSHEIMER,

No. 338 Montgomery street, Corner of California street, San Francisco. 23v9tfq

NOTICE TO MINERS.

THE UNDERSIGNED WILL SELL

MINING STOCK

In Incorporated Companies and Unincorporated Mines, in San Francisco District and in El Dorado District, Arizona Territory. It is confidently asserted and believed by most practical miners that Arizona is the richest mining country in the world. Recent developments of these mines are now attracting the attention of capitalists, who have already erected several mills, and more are going there soon. Now is the time to invest to advantage, and obtain the rise that must soon follow. Those wishing to purchase soon can do so, on most liberal terms, by calling on MR. RODNEY CLARK, 338 Montgomery street (room No. 11), San Francisco, or on H. C. SKINNER, San Jose, California.

N. B.—Freight all the way by water at a cost of 4½ cents per pound.

H. C. SKINNER,

San Jose, California.

IN THE DISTRICT COURT OF THE FIFTEENTH JUDIcial District of the State of California, in and for the City and County of San Francisco.

JANE E. LYKINS, Plaintiff, vs. ISAAC N. LYKINS, Defendant.

Action brought in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and the complaint filed in said City and County of San Francisco, in the office of the Clerk of said District Court.

The People of the State of California send greeting to Isaac N. Lykins, defendant: You are hereby required to appear in an action brought against you by the above named plaintiff in the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, and to answer the complaint filed therein, within ten days (exclusive of the day of service) after the service on you of this Summons, if served within this county; or, if served out of this county, but in this district, within twenty days; otherwise within forty days, or judgment by default will be taken against you, according to the prayer of said complaint.

The said action is brought to obtain a decree dissolving the bonds of matrimony existing between plaintiff and defendant; that the property described in the complaint herein be adjudged to be the plaintiff's separate property, and that the defendant be adjudged to have no interest whatever in the same, and for general relief. And you are hereby notified that if you fail to appear and answer the said complaint, as above required, the said plaintiff will appear in the Court for the relief therein.

Given under my hand and seal of the District Court of the Fifteenth Judicial District of the State of California, in and for the City and County of San Francisco, this 14th day of February, in the year of our Lord one thousand eight hundred and sixty-five.

[Stamp and seal.] WM. LOEWY, Clerk,

REPAIRING NEATLY DONE, AT SHORT NOTICE.

No. 623 Sansome Street,

Between Washington and Jackson streets, San Francisco. 15v10-1m*

FOSSIL REMAINS.—The San Andreas *Independent* says that the bones of a huge animal has been uncovered at Murphys, the knee joint of which weighs 56 pounds. The other bones are in the same proportion, and they show that a species of animal, larger than any that are now known, once existed in this country. It adds that at the same place a piece of an elephant's tusk was found by the miners, which had laid under ground so long that it had become petrified.

WHAT is the world? A dream within a dream—as you grow older, each step has an inward awakening. The youth awakes, and he thinks from childhood: the full growu man despises the pursuits of youth as visionary; the old man looks on manhood as a feverish dream. Is death the last sleep? No—it is the last final awakening.

IRON DISH-CLOTHS.—The ladies will be surprised to hear of iron dish-cloths, yet such articles are on record, and in use. They are made of connected fine wire rings, are very flexible and for many purposes excel the old style.

Mining Notices--Continued.

Arizona Consolidated Mining Company, Eureka District, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 29th day of April, 1865, an assessment of fifty cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company.

Any stock upon which said assessment shall remain unpaid on Saturday, the 3d day of June, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Wednesday, the 21st day of June, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

JOHN Q. ADAMS, Secretary.

Office, No. 6 Montgomery Block, San Francisco. my6

And in accordance with law and an order of the Board of Trustees, made on the 13th day of March, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at public auction, by John Middleton & Son, No. 400 Montgomery street, San Francisco, on the 6th day of May, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

N. DUPERU, Secretary.

Office, No. 710 Sansome street, San Francisco.

POSTPONEMENT.—The above sale is hereby postponed until Saturday, May 13th, 1865, at the same hour and place. By order of the Board of Trustees.

aur22 N. DUPERU, Secretary.

POSTPONEMENT.—The above sale is hereby postponed until Saturday, May 27th, 1865, at the same hour and place. By order of the Board of Trustees.

my20 2w N. DUPERU, Secretary.

Good Hope Gold and Silver Mining Company, Alpine District, Alpine County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 15th day of May, 1865, an Assessment of fifty cents per share was levied upon the Capital Stock of said Company, payable on or before the 12th day of June, 1865, in United States gold and silver coin, to the Secretary, or to H. MORRIS, at Markleeville. [*Delinquents will be held for accruing costs after the 12th day of June.*]

Any stock upon which said Assessment shall remain unpaid on Saturday, the 17th day of June, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 1st day of July, 1865, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

PRESTON MORRIS, Secretary.

Office, 526 Montgomery street, San Francisco. my20

Harmon Gold and Silver Mining Company, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 4th day of May, 1865, an assessment of one ($1) dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 728 Montgomery street (up stairs), Room 4, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 3d day of June, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 19th day of June, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees. Ten per cent. discount on all assessment paid on or before the 15th day of May, 1865.

T. J. JONES, Secretary.

Office, 728 Montgomery street, San Francisco. my6

Keokuk Gold, Silver and Copper Mining Company, Clayton District, Contra Costa County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 4th day of May, 1865, an assessment of 7½ cents per share was levied upon the assessable stock of said Company, payable on the 6th day of May, 1865, in United States gold coin, to the Secretary, or to W. W. Bona, at Clayton.

Any stock upon which said assessment shall remain unpaid on Saturday, the 3d day of June, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 19th day of June, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

my27 F. D. GALLAGHER, Secretary.

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

DEWEY & CO.,

Publishers and Job Printers,

Office Mining and Scientific Press, San Francisco.

U. S. 7-30 LOAN.

By authority of the Secretary of the Treasury, tha undersigned has assumed the General Subscription Agency for the sale of United States Treasury Notes, bearing seven and three-tenths per cent. interest per annum, known as the

SEVEN-THIRTY LOAN.

These Notes are issued under date June 15th, 1865, and are payable three years from that time in currency, or are convertible, at the option of the holder, into

U. S. 5-20 Six Per Cent.

GOLD BEARING BONDS.

These Bonds are now worth a premium of nine per cent. including gold interest from November, which makes the actual profit on the 7-30 loan, at current rates, including interest, about ten per cent. per annum, besides its EXEMPTION FROM STATE AND MUNICIPAL TAXATION, WHICH ADDS FROM ONE TO THREE PER CENT. MORE, according to the rate levied on other property. The interest is payable in currency, semi-annually, by coupons attached to each note, which may be cut off and sold to any bank or banker.

The interest amounts to

One cent per day on a $50 note,
Two cents per day on a $100 note,
Ten cents per day on a $500 note,
Twenty cents per day on a $1,000 note,
One dollar per day on a $5,000 note.

Notes of all the denominations named will be promptly furnished upon receipt of subscription. This is

The only Loan in Market

now offered by the Ooverpment, and it is confidently expected that its superior advantages will make it

THE GREAT POPULAR LOAN OF THE PEOPLE.

Less than $300,000,000 of the loan authorized by the last Congress is now on the market.

This amount, at the rate at which it is being absorbed, will all be subscribed for within four months, when the notes will undoubtedly command a premium, as has uniformly been the case on closing tha subscriptions to other Loans.

In order that citizens of every town and section of the country may be afforded facilities for taking the Loan, the National Bank, State Banks, and Private Bankers throughout the country have generally agreed to receive subscriptions at par. Subscribers will select their own agents, in whom they have confidence, and who only ara to be responsible for the delivery of the notes for which they receive orders.

JAY COOKE,

Subscription Agent, Philadelphia.

March 25, 1865. 17v10-3in

ADDENDUM.

PER OVERLAND TELEGRAPH:

PHILADELPHIA, May 17, 1865.

Second Series all sold. Commenced on Third Series. Two Hundred and Thirty Millions (230,000,000) precisely like other two Series, except dated 15th July, and Government reserves the right to pay six per cent. in Gold instead of 7-30 Currency.

19v10 With MARSH, PILSBURY & Co.

Pacific Mail Steamship Co.

Tha following Steamships will be dispatched on the following named days.

June 3—GOLDEN CITY.....Capt. W. F. Lapidge.
June 18—CONSTITUTION.....Capt. J. T. Watkins.

From Folsom street Wharf

At 11 o'clock A. M., punctually to the bour,

For Panama.

Passengers will be conveyed from Panama to Aspinwall by the Panama Railroad Company, and from Aspinwall to New York by the Atlantic and Pacific Steamship Company.

A Baggage Master will be sent through each trip.

Cabin passengers will be berthed for Atlantic steamer.

OLIVER ELDRIDGE, Agent.

Corner Saeramento and Leidesdorff sts.

HELMBOLD'S

FLUID EXTRACT BUCHU

For Non-Retention or Incontinence of Urine, Inflammation or Ulceration of the Bladder or Kidneys, Diseases of the Prostrate Gland, Gravel, Brick Dust Deposits, Dropsical Swellings, Organic Weakness, Debility, Female Complaints, Etc.

H

HELMBOLD'S

FLUID EXTRACT BUCHU

—AND—

Improved Rose Wash

Will radically exterminate from the system Diseases arising from Habits of Dissipation, *at little expense, little or no change of diet, no inconvenience or exposure*; completely superseding those *unpleasant and dangerous remedies, Copaiba and Mercury*, in curing these diseases.

U

USE HELMBOLD'S

FLUID EXTRACT BUCHU

In all Diseases of the Urinary Organs, whether existing in MALE OR FEMALE, *from whatever cause originating, and no matter of how long standing*. It is pleasant in its taste and odor, IMMEDIATE in action, and more strengthening than any of the preparations of *Bark or Iron*.

Those suffering from *Broken Down or Delicate Constitutions, procure the Remedy at once.*

The reader must be aware that however slight may be the attack of the above diseases, it is certain to affect his *Bodily Health, Mental Powers and Happiness*. If no treatment is submitted to, Consumption or Insanity may ensue.

All the above diseases require the aid of a diuretic.

Hembold's Extract Buchu

IS THE GREAT DIURETIC.

L

HELMBOLD'S

HIGHLY CONCENTRATED

Compound Fluid Extract Sarsaparilla,

For purifying the Blood, removing all diseases arising from excess and imprudence in life, chronic constitutional diseases arising from an impure state of the blood, and the only reliable and effectual known remedy for the cure of Scrofula, Scald Head, Salt Rheum, Pains and Swelling of the Bones, Ulcerations of the Throat and Legs, Blotches, Pimples on the Face, Tetter, Erysipelas, and all scaly eruptions of the skin, and beautifying the COMPLEXION.

M

NOT A FEW

Of the worst disorders that afflict mankind arise from the corruption that accumulates in the Blood. Of all the discoveries that have been made to purge it out, none can equal in effect HELMBOLD'S CONCENTRATED EXTRACT OF SARSAPARILLA. It cleanses and renovates the Blood, instills the vigor of health into the system, and purges out the humors which make disease. It stimulates the healthy functions of the body, and expels the disorders that grow and rankle in the Blood. Such a remedy, that could be relied on, has long been sought for, and now, for the first time, the public have one on which they can depend. Our space here does not admit of certificates to show its effects, but the trial of a single bottle will show to the sick that it has virtues surpassing anything they have ever taken.

B

Two tablespoonsful of the Extract of Sarsaparilla, added to a pint of water, is equal to the Lisbon Diet Drink, and one bottle is equal to a gallon of the Syrup of Sarsaparilla, or the decoction as usually made.

The above Extracts are prepared on purely scientific principles—in *Vacuo*—and embody the full strength of the ingredients entering into their composition. A ready and conclusive test will be a comparison of their properties with those set forth in the U. S. Dispensatory.

O

HOW TO USE THE REMEDIES.

In Diseases of the Blood, Humors on the Face, or any and every part of the body, use Extract of Sarsaparilla, applying to Pimples and all external Humors or Eruptions the Improved Rose Wash.

Use the Extract Buchu for all diseases requiring the aid of a diuretic, except those of the Urinary Organs, such as Gonorrhœa and Gleet; in these use the Extract Buchu, and inject with the Improved Rose Wash.

L

☞ THESE EXTRACTS HAVE BEEN ADMITTED TO USE IN THE UNITED STATES ARMY, and also are in very general use in all the STATE HOSPITALS AND PUBLIC INSTITUTIONS throughout the land, as well as in private practice, and are considered as invaluable remedies.

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, beat pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchasa none unless my private Government Stamp is on the box. Soe upon it "B. Brandreth " in white letters.

BALDNESS

Can be Cured!

MR. M. HOWARD, from Virginia City, Nevada, has discovered and patented an ENTIRELY ORIGINAL ARTICLE for producing a fresh, vigorous and permanent growth of the Hair upon the human scalp, where total or partial baldness has prevailed. His remedy is the assistant of Nature itself, enabling the Hair to penetrate the scalp and sustain its growth. It is simple and harmless in its application, but powerful in its good results, reproducing hair upon bald heads of long standing and preventing the hair from falling out. Mr. Howard will show interested parties calling upon him, at his room, No. 15, second floor, at 522 Montgomery street, San Francisco, a long list of affidavits, containing positive recommendations of his RESTORATIVE from prominent residents of Virginia City who have been benefitted by its application. 17v10

and strike upon the die H, upon which the quartz is deposited anew, at every blow, by the plunger M running up and down the feed spout L. From the die the hammer is drawn backward, and with it the partially crushed quartz; the hammer gliding along the spring bar shown, and the quartz falling through an opening upon the sieve S, through which passes the dust, while the courser particles are carried by the spout T into the elevator O, and then returned to the feed spout to be re-

stant of striking, this point of connection and the hammer are on opposite sides of the center of motion. By this arrangement there is produced the natural hammer blow. The operation is remarkably simple, and at the same time, to one looking upon it for the first time, it seems extraordinary. The inventors, Messrs. Rix & Logan, of this city, claim that they are able to crush, with this machine, five tons per day with one-horse power. We would call particular attention to the advertisement of the

tions for developing the same. The company has heretofore been in circumstances which would not admit of a proper working of the vein. We trust that their efforts may meet with the most abundant success. The ledge is favorably located for working; is heavy and continuous, as is proved by the out-croppings, which can be traced for more than a mile. It shows three and a half feet wide in the main shaft, at a depth of thirty feet. A lot of 800 pounds of average rock, recently crushed by

THE HAMMER QUARTZ MILL.

The structure of this machine, as well as its *modus operandi*, will be apparent to mechanical readers after a moment's inspection of the engraving in connection with the subjoined explanation:

The shaft C, is turned to the left by a pulley not shown. The hammers F G are revolved, rounded.

The peculiar feature of this machine is the novel method of attaching the hammer to the arm or center-piece D. In all revolving hammers heretofore known, the attachment has been such that the hammer, at the time the blow is struck, is on the same side of the axis of motion as its connection with the arm or center-piece; while in the machine, at the in-

proprietors, which will be found in its appropriate place.

THE BLUE LEDGE.—A company known as the Blue Ledge Quartz Mining Company, and located in Kelsey District, near Spanish Flat, El Dorado county, and who claim to have the true or mother vein, known as the "Blue Ledge," are about commencing active opera-

hand, yielded at the rate of $35 to the ton. Smaller lots worked by Mr. Salmon, in his amalgamator in this city, have returned upward of $50. Assays have reached as high as $90. The parties now in charge of the mine, are about to take out a lot of 100 tons for crushing, the result of which will be reported.

Back Volumes of the MINING AND SCIENTIFIC PRESS from January 1, 1864, to the present time will be furnished at $3 per volume.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

THE AGE OF GOLD-BEARING ROCKS.

BY THOMAS ROWLANDSON, FELLOW OF THE GEOLOGICAL SOCIETY, LONDON.

NUMBER FOUR.

RATIONAL OBJECTS SOUGHT BY A GEOLOGICAL SURVEY—CONTINUED.

In my last paper, published April 29th, I adduced an instance where, notwithstanding there existed the fairest grounds for believing that certain predicted results would follow, according to all reasonable probability, by sinking or boring at a given locality, the event negatived the conclusione arrived at by a priori reasoning. The fact was a remarkable one, and nearly wholly unexpected, though, as already related, Mr. Godwin Austin taking a *wider* sphere of observation, had indicated the probability of such an occurrence; so that, in fact, although the boring at Kentish Town disappointed the anticipations of almost all the geologists who had paid attention to the subject, yet it cannot be adduced as a souud reason why geological knowledge should be despised or neglected, because, although at fault in the instance adduced, it was one that might not occur in a hundred thousand similar trials. Every reasonable ground existed for believing that the result would eventuate as predicted, and the case only serves as an additional instance to illustrate how extremely careful every one entrusted with such invcstigations should be in giving very positive opinions, whenever there exists the slightest ground for euspectiug the probability, however remote, of any disturbing iufluenco being present.

Even, however, in the case alluded to, I have shown that the *possibility* of a disappointment, such as actually did occur, had been pointed out hy Mr. Austin, and although a commercial failure and economical loss wae the result of the operation, the fact itself only established the profoundness of the views held by Mr. Austin on theoretical grounds only, which latter most probably would have been much less generally accepted, had it not been for the occurrence of the unexpected practical illustration of its soundness which I have detailed. No reader, possessed of common sense, can peruse the details connected with the illustration given without conceding that a geologist'e duty eonsists quite as much, or more, in cautioning adventurers respecting the chances of disappointment, rather than the encouragement of toilsome labor aud capital being expended iu hazardous enterprises.

What has just preceded relates more to the proper selection of positions on which to commence mining or similar operations. These once commenced, and tbe exploiting carried forward, indications will be continually presenting themselves of a most unmistakable character, when inspected by any one even only partially acquainted with mining, and renders it the more wonderful that such enormous mistakes have occurred iu the working of some of the principal silver mines at Washoe. Take, for example, those worked hy the three most eelebrated companies on the Comstock lead: The Ophir, the Mexican and the Gould & Curry, each of which has had one or more easce of "cave in;" in every instance, however, accompanied by the aunouncement that the eave-in had laid bare rich deposits, or ore which had been previously passed over in working dowuwards; a somewhat naive admission of extraordinary ignoranee or mismanagement on the part of the working superintendent ae regards the geology of mining, to eay nothing of the mechanical obtuseness that permitted the mino to cave-in at all. As such catastrophes are only the consequence of ill-managed exeavations, it might have heen thought that such glaring instances of practical ignorance on the part of the employees of these companies would at least have produced an investigation iuto the causes of these repeated mishaps. Instead of this, however, the trustees, or other managing bodies, appear to have treated these instances of mismanagement with favor rather than censure, because on each occasion the cave-iu was accompanied by the discovery of pockets of ore which had been *previously overlooked*. Such conduct reminds me of the druil story told by Charles Lamb, of "the mountain of roast pork."

In the earlier days of the Chinese empire, loug anterior to the Ming dynasty, a member of the flowery land accidentally had an outhouse hurned down, in the couflagration of which an unlucky member of the porcine race perished. The story goes that the unfortunate owner, being eager to save all that he could from the glowing embers, dragged therefrom the singed carcass of poor piggy, which, however, was so hot that he hurned his fingers, and in order to cool them the Chinaman raised them to his lips to hlow on them. The fragrant odor of roast pork thus carried to the nostrils induced him to ascertain the flavor, which he found so pleasant that the carcass was carefully scraped, cleaned, cut up and served to form the basis of a sumptuous feast; his friends being invited to partake and pass their opiuion on this primitive mode of producing porcine "carne con cuero." So the invention became known and spread ronnd, and thereafter whenever an opulent Chinaman desired to regale his friends in an ahundant and hospitable manner, he placed a hog in a building, and setting fire to the latter, the roasted remains of the former, after dressing, were eerved to his guests. In this way, for centuries, was roasted pork prepared for Chinese feasts, until some more ingenious fellow discovered that it was not altogether necessary to burn down a housc every time that a pig needed roasting.

From the jubilant manner, however, in which the managers of the mines named announced every "cave-in" with the simultaneous discovery of rich but heretofore nverlooked ores, it may be supposed that their ideas respecting the management of mines are about as reasonable as the aboriginal Chinaman who burned down a house every time he required roast pig. It did not require a very recondite knowledge of the laws relating to mineral veins and their metallic contents, to have discovered the unwrought ores overlnoked, and only hrought to notice by a "cave-in." Yet euch is the state of mining management up to this time in California and Nevada.

To advise upon and disseminate information relative to such important topics, are amongst the foremost duties of the chief State Geologist. How far that individual has attended to them I will not attempt to detail, for it would be difficult to find any instances of such usefulness. A studied reserve on all matters connected with geology, so far as this State and its residents are concerned, appeare to have actuated Professor Whitney throughout his entire term. This reticence he has defended on the ground that he was not permitted, by the act of the Legislature which made the appropriation, to disseminate information; a reetriction, if true, in spirit as foolish as it was unwise, hut which Professor Whitney, although he has adhered almost to the letter, so far as the restriction related to the residente of California, has, nevertheless, wheu it suited his own purposes, not hesitated to break through the rule when it pleased him to illuminate other more distant and less interested regions, respecting which more will be said in my next.

[To be continued.]

Mining Laws of Marsh Creek Mining District, Contra Costa County, State of Cal.

Adopted at a meeting held in said district by the miners, for the purpose of defiuing the district, and making proper mining laws for the same.

On motion of Dr. E. F. Hough, Mr. L. D. Welsh was chosen Chairman of the meeting, aud Mr. W. Brandreth, Secretary. On motion of Mr. F. Latture, it was resolved that a committee of five be appointed to draft resolutions and by-laws. The Chairman then appointed David Huffard, Geo. Roberts, Francis Tracy, W. F. Brandreth and William Phillipps.

The eommittee presented tho followiug resolntions, rules and hy-laws, which were unanimously adopted:

Resolved, That as Congress has made no rules and regulations for the government of the mining districts of the State, and, as the State Legislature of California has provided hy Statute, and accorded to the miners of California, the right of making all laws, rules and regulations that do not conflict with the Constitution aud laws of California, in all actions respecting "*mining claims*."

Resolved, That this district shall hc known as the Marsh Creek Mining District, and shall consist of the following townships, to wit: One north range two east, one south range two east and nne south range three east, Mount Diablo meridian; excluding all homsteads and improved pre-emption claims.

RULES AND REGULATIONS.

Art. 1st. A claim in this district shall eonsist of two thousand six hundred and forty (2,640) feet square.

Art. 2. That every person who shall locate a claim in this *district*, shall be required to post a notice giving the boundaries of his claim, iu a conspicuous place, which shall hold said claim for ninety (90) days. Before the expiration of this time, from date of location of the same, the party having posted said no tice, shall be required to do or have done, one day's work on his claim, which shall hold the same for the following six months, and one day's work for every six months following shall hold his claim thereafter.

Art. 3. Every person locating claims in the said district, shall be required, within five days after posting said notice, to have the same recorded by the Recorder of the said district, and the Recorder shall receive for such services, one dollar for each notice so recorded.

Art. 4. When a company of persons locate or have located more than one claim, they shall not he required to do the work required in Art., 2, of thie code of laws, npon every claim separately. But they shall be at liherty to do the whole amount of work upon auy oue or more of the different claims.

Art. 5. A Recorder sball be elected and shall hold office for one year. It shall be his duty to keep a book and properly record therein all notices of claims presented to him, in conformity with Art. 3, nf this code of laws. It shall be the duty of tbe Recorder to deliver to his successor in office, all books, records, papers, etc., helonging to or pertaining to his office, all transfers shall be noted in the book of records; for which service the Recorder shall receive the sum of fifty cents each.

Art. 6. These laws shall not he changed without the consent of five-sixtbs of the occupants of claims in this district.

Art. 7. These hy-laws, rulee and regulations shall take effect from and after the tweuty-seventh day of May, A. D. 1865.

On motion of Dr. E. F. Hough, these hy-laws, rules and regulations were unanimously adopted.

On motion of the same, Mr. L. D. Welsh was unauimously electcd Recorder for this district.

On motion of the same, it was resolved that all present, at this meeting, having claims, said claims now stand recorded.

On motion of the same, it was uuanimonsly resolved that the minutes of this meeting together with by-laws, rnles and regulations, be published in the Mining and Scientific Press, and the Contra Costa *Gazette*.

COMMITTEE ON BY-LAWS.

W. F. Brandreth, David Huffard,
George Roberts, Francis Tracy,
Wm. Phillipps.

MEMBERS PRESENT.

Dr. E. F. Hough, F. Latture,
C. Hoffman, P. Sappington,
S. S. Welsh, W. S. Henderson,
C. Sappington, Alfred Boss.

L. D. WELSH, Chairman.
W. F. Brandreth, Secretary.

A Machine for Framing Tunnel Timber.

The Gold Hill *News*, describee a very important aud valuable machine recently invented by Messrs. Deuver & Hockholzer, of Glod Hill, has been huilt to run by steam power, and will prepare all kinds of timbers for mining purposes at less than one-sixth the present cost, and with perfect accuracy. The machine will be put at work at the Savage mine. The following is a description, from specifications and plans: A sliding tahle, bearing the timher designed to he framed, run upon a wooden frame having ways in grooves beneath, and so regulated as to be forced to the front by a hand wheel, piuion and rack. The timber used heing hewed, but not square nor of uniform thickness, are first properly entered and marked with a line of chalk, and then plced on the frame in a circular iron haud, and so adjusted with set-screws that the chalk lineson the timher shall correspond with the lines marked at right angles and tbrough the center of the circular iron hand which revolv in the standard securely bolted to the iron tahle. After due adjustment of the timber, the hand is fastened to the standard with an iron pin, and the timber forced forward against the cutters, the timber passing over tbe same These cutters are made like ordinary planin kuives, and have an addition of a small circular saw for cutting the square shoulder on the timher. The bevel cutters are without the saw, and are placed at the end of a rapidly raislving shaft, so adjusted in brackets as to be rded or lowered, eo as to cut any eized tenant. The iron hands holdiug the timber revolve one-quarter revolution at a time, at an angle of ninety degrees, without any displacement of the timher, thus cutting the same at an equal bevel on all four eides; again, after cuttiug the tenant, the timber is moved forward against two circular saws that square the ends of the same, and the work is completed—no subsequent dressing being required as in other inventions of the same character.

The Glacial Theory.—The primary object of the scientific visit of Professor Agassiz to South America is to test his glacial theory

MINING IN AUSTRALIA.

We have mining advices from Australia to March 1st. The reports are very favorable; the yield in Victoria, the prineipal gold producing colony, keeps well up to that for the two or three years preceding. The amount of gold received at Melbonrne during the year 1864 was $27,000,000. The number of miners engaged in taking it ont was 83,394. The average *per capita* was therefore about $320. This yield compares quite favorably with that of the two preceding yeare, considering that the last was an unusually dry one. The yield for 1862 was, in round numbers, $29,500,000, taken out hy 97,942 minere; that for 1863 was $27,500,000, taken out by 92,292 minere. Considering the nnmher of men engaged, the yield of the last year was in excess of that of the two previous ones. Important discoveries of immense tructs of auriferous lands have recently been made in the neighborhood of Gipps' Land, the alpine portion of Victoria. The country is very difficult of access, but the yields of gold are so enormous that all difficulties are readily snrmounted. Very little gold is produced in either South Australia or New South Wales.

A project for a gigantic mining organization has been started at Sidney, which embraces in its field of operations not only New Sonth Wales, hut other portions of Australia also, and Tasmania and New Zealand as well. The scheme embraces mining for gold, silver, copper, lead, iron aud other metals. The movement was talked of as though it would be carried out, and "great expectations" were indulged in with regard to its probable success.

COPPER MINING.

The workings for copper in both South Australia and New South Wales appear to be progressive, although as yet hut eight copper mines have heen opened in the latter named eolony. The chief Australian yield of this useful metal is in the southeastern portiou of South Australia, and from 150 to 250 miles distant from the port of Adelaide. In this neighborhood is found the famous Burra Burra mine. At Moontana the workings are constantly disclosing new lodes, oftentimes very rich, from one to two feet in thicknees of eighteen to twenty per cent. ore. Ahout 800 hands are employed there. The Wallaroo yields large quantities of ore, hut of a poorer quality than that from Moontana. A strike has recently taken place among the smelters at the Wallaroo mines, and at last accounts the furnaces had heen idle for two months. The directore had, in consequence commeuced shipping ore to England. There are now seven furnaces and one refinery in opcration at Port Adelaide.

A Frarful Scene.—A wild and fearful scene occarred recently at the Syracuse (New York) depot. As the cars which made np the Oswego train were standing in the Central depot, a locomotive, without engineer or fireman, came dashing in from the east and plunged into the last car of the train, driving the whole train like lightning out of the depot, a distance of twenty rods, wrecking the whole thing. The mysterious appearance of this wild engine was as follows: The engine had been dispatched east, and on approaching the tunnel near Syracnse the engineer saw a wood train approaching from the east. Both engineers reversed their engines and jumped from their machines. A collision took place, smashing the locomotive coming from the east. The locomotive going east had its hind truck thrown off, hut heing revereed the engine etarted back towards Syracuse, its speed increasing every foot until it was making a speed of a mile a minute, the hind trucks gone and the tender houuding into the air, it dashed into the Oswego train, by which the escape valves were broken off, the steam rushed out, and the tank heing broken into the water gushed out, and the phantom locomotive gave its last gasp. The crash and steam and cries of affrighted people made up a terrible scene, hut, happily, without lose of life, and it is a wonder, as the escaped engine, in its race, crossed eleven streets, and dashed through a crowd of four hundred people. The cause of all this was that the engine went out on the wrong track, the right track being out of repair, owing to the flood.

In one of the largest establishments in Paris, a lady's crinoline, "worth $400," is exhibited.

Mechanical.

OUR FOUNDRIES.

There is no circumstance connected with the growth and prosperity of our city which so impresses intelligent strangers from the East, as the rapid development of our mechanical interests. A visit to any one of our first class foundries is, in fact, quite an astonisher. The facilities which we possess for turning out heavy work, in San Francisco, is entirely beyond anything which they have supposed could possibly exist in a city but sixteen years old. In pursuing our rambles among the foundries the past week we dropped into the Union Foundry, now carried on by Messrs. H. J. Booth & Co. We are indebted to the attentions of Mr. Booth for a careful look through this extensive establishment—a perfect hive of industry. We propose at some future time to note some of the many improvements in the character and class of machinery now employed in this foundry. Our present purpose is to merely make brief mention of some of the work which we saw in progress there.

Our attention was first called to three locomotives, two of which they are building for the San Jose Railroad, and one for the Sacramento Valley Railroad. These locomotives will weigh fully thirty tons each. In their construction they will combine all the best features of the engines of Eastern make, together with many improvements devised here. One great advantage of locomotives of California make will be their perfect freedom from the prejudices of competing manufacturers, a lack of which often operates greatly to the detriment of Eastern machines, by preventing the acknowledgment and adoption of really valuable improvements, for the simple reason that they originate in the shops of rival manufacturers. We look upon this as the introduction of a very important branch of industry upon this Coast.

In the lathe was a pattern of one of Wheeler & Randall's new tractory pans, of unusually large dimensions—fifty-four inches diameter of muller, the usual size of pans being about forty-five inches. These pans are made of three sizes—fifty-four, forty-eight and twenty-four inches. They are made with the base either up or down.

A twenty-stamp mill left this foundry, the past week, for Birdsall & Carpenter, of Dayton, Nevada. Ten of Wheeler's improved pans went forward, with five settlers, three *lavaderos*. (a washing tub, similar to those in use at Frieberg and in Mexico) and a shaft and castings for a fifty-foot water wheel. About fifty tons of castings have left the foundry within the last ten days.

They have now under way a thirty-horse power engine with hoisting and pumping gear, for Messrs. Henniug, Findley & Co., of the Union Gold Mining Company, of Grass Valley; two thirty-horse power engines, with hoisting and pumping gear complete, for the Idaho Company, Grass Valley, and a ten-stamp mill for Reese River. They are also manufacturing two boilers for parties in Stockton, and two others for Reese River parties. They are also doing all the work for the Reese River Metallurgical Co., an association under the management of Capt. Uzuay, and organized for general metallurgical operations in silver, lead, etc., at some point in the Reese River country. The patterns for a new pan invented by Mr. Orin Balden are also nearly ready to leave the pattern shop. This pan is said to possess some new and important points with regard to running gear, mullers, etc. The Mammoth Quartz Mining Company of Shasta, is having the Wheeler & Randall pans, settlers, shaftings and fixtures for their new mill manufactured at this foundry; also the Union Q. M. Co. of Klamath county, in this State.

We noticed in the boiler room, several rhomboidal shaped iron boxes in course of construction, which we were informed were to be used as "schutes" in which to haul up quartz from the incline of the Crescent Mill Company's mine in Plumas county. This peculiar shape has been designed as most convenient for such work. The manufacture of car wheels and axles is a new branch of business recently introduced into this foundry. They have now on hand an order for the San Jose Railroad. A new crank-pin is also being made here for the Moses Taylor, which boat, it will be recollected had the misfortune to break one on her last up trip. The place of the broken one was supplied by a spare one on board, and the one now being manufactured is to meet any similar future emergency. These are among the leading "jobs" on hand at the time of our visit. An Eastern foundry with that amount of work on hand would be considered a first class establishment there. The foundry is now running night and day.

The San Francisco Foundry, Devoe, Dinsmore & Co., proprietors, is getting to be quite a busy locality. During a visit there, a few days since, our attention was particularly attracted to the amount and variety of mining machinery displayed about the premises. Our attention was first directed to one of Rix, Logan & Co.'s unique quartz mills, which is at all times in position to be started up for exhibition to parties who may desire to learn something of its qualities. This machine is illustrated and fully described on the first page of the present issue. We next examined one of Beaux & Guiod'e pans, which have already been fully described in our colums. Salmon's Amalgamator & Separator, Henckle's Amalgamator and Crusher, are also all to be seen in operation at this establishment.

We noticed a fine engine, with ten-inch cylinder and twenty-inch stroke in process of construction at this foundry. This engine we understood was being built for the Union Coal Mining Company at Mount Diablo. We also noticed that quite a number of Hanshrow & Redding's pumps were being finished off, besides a large amount of general work. Messrs. Devoe, Dinsmore & Co., by their energy, industry and skill are rapidly building up a fine business, which we trust may be profitable to them and useful to the community. They are now well prepared to do any work in their line of business.

Looking into the Golden State Foundry, we found all hands busy as usual. In passing through the shops we noticed, in addition to much general work, the following specialities in various stages towards completion: A ten-stamp mill for the Reese River Mining Co., with pans, settlers, retorts, etc., complete, just being finished up; one ten-stamp mill with Knox'e pans, for the Excelsior Mill Co.; one five-stamp mill for Chrystal Peak, Wasboe; one prospecting mill and arastra for Idaho; one hoisting engine and gearing for the Bunker Hill mine, Amador county; one small double geared hoisting engine for the California Steam Navigation Co., to be placed on the levee at Sacramento, for hoisting freight from their boats, and one mining pump for Mexico.

Hinckley & Co., of the Fulton Foundry, shipped last week, for the Nevada Silver Mining Company, of Humboldt, A. Stevenson, Superintendent, a ten-stamp mill, comprising four of Varney'e pans, two of Varney's settlers, two of Prater's concentrators, one of Beth's grinders and two roasting furnaces. The boiler is forty-four inches in diameter, sixteen feet long, with forty-four three-inch tubes. This mill has been manufactured under the supervision and according to plans prepared by Mr. Hungerford, millwright, one of the proprietors of the patent right of Hungerford & Prater'e pan. The machinery was sent forward *via* the Chico and Honey Lake route.

The English Iron Market.—It was expected that when the iron masters of Staffordshire had concluded to re-open their works, after five weeks of lock-out, the difficulties which had for some two months embarrassed the operations of the iron trade would have been quite fully removed. The result, however, has proved otherwise. The attitude assumed by a considerable portion of these men seems to have created much anxiety with regard to the future. In fact the impression appeared to prevail that fresh demands would soon be made by the employees, and that the real battle was yet to be fought. Many of the men refuse to go to work unless the masters will agree to the establishment of a Court of Arbitration, to which all disputes between masters and men may be referred, thus rendering unnecessary both strikes and lock-outs. The iron trade is very flat; both buyers and sellers being chary about operating to any extent. A large number of men are on a strike in Scotland. Rylund's (Birmingham.) *Stock Circular*, of April 13th, reports that an offer of 500 foreign puddlers had been made to the North Staffordshire masters, at a discount of twenty-five per cent less than the wages heretofore paid.

A NEW TUNNEL-DRIVING MACHINE.

The London *Mining Journal* speaks encouragingly of a highly interesting and important experiment, which was in progress, about the middle of April last, near the residence of Mr. M. B. Beaumont, at Wakefield, near the South Yorkshire line of railway, in England. The experiment was for giving a practical test of the value of a tunnel-boring machine, the invention of Mr. Beaumont, who is a Captain in the engineer corps. The result, up to the time of the report had been very satisfactory, and had given quite conclusive evidence of the feasibility of obtaining by the use of this machine a rate of progress in driving tunnels in hard rock, altogether beyond anything heretofore effected. It was thought that fully *six feet* could be driven in quite hard rock, in eight hours. The working of the machine is described as follows:—

A series of cutters, or jumpers, are arranged around the periphery of a strong iron wheel or bore head, which latter is also armed at its center with a single tool. The system is set in motion by steam or compressed air, acting through the medium of a piston and cylinder, with its necessary accessories of valves, &c., giving a series of heavy blows, while at the same time the bore-head rotates slowly on its axis, thus cutting a continuous chase or groove, which isolates a cheese-shaped mass of rock; the center tool, or jumper, has meanwhile cut a central hole capable of containing a sufficient amount of powder to shatter the rock thus left free to receive the full force of the explosion. The diameter of the tunnel now being cut is five feet two inches, and the tools or jumpers being the outside of everything, the machine can readily follow the bore-head carrying them. During the week, in one day, the machine had completed nine feet six inches, the last twenty-three and one-fourth inches being cut in one hour and forty minutes, and the time taken by one man in breaking up the mass (after the charge had been fired) and passing it through the bore-head was one hour and a half. It is needless to remark that this is irrespective of the time taken in manipulating the machine and jumpers, which as at present arranged constitutes by far the longest part of the whole operation. Mr. Bacon, however, who is conducting the experiments on the part of the manufacturers, Messrs. Bryan, Donkin & Co., already sees many ways of increasing the mobility and handiness of the machine, which appears, imperfect though it is, to have already exceeded in point of speed the anticipations of its projectors.

Steel vs. Iron.—The Maryport and Carlisle railway company, England, has recently experimented largely in the economy of employing steel to a great extent as a substitute for the ordinary iron used in the working portion of the locomotive. It has been ascertained, among other things, that steel tyres in the driving wheels, will run fully seven times as long as an iron tyre—to say nothing of the less amount of time lost in repairs, while the difference in the first cost is only about one-third. The company are now experimenting upon steel boilers, axles, cranks, eccentrics, etc. The subject of this substituting steel to a greater extent than it has heretofore been used for such purposes is considered one which should receive the careful consideration of railway managers.

Valuable Sweeping.—One hundred and one barrels of sweeping of the Mint have been shipped to Philadelphia, the collections of the past year. Each barrel is supposed to be worth about $50, more or less. Samples of each are sent along, by which they will be sold, and shipped to Europe for manufacture, where labor is cheaper.

Improvement to the Mowing Machine.—A week or two since we briefly noticed that an important improvement had recently been made to the mowing machine, by a lady. We now learn from the *Country Gentleman*, that the fair inventor is Mrs. Elizabeth M. Smith, of Burlington, N. J., and that its history is as interesting, as the improvement is valuable. A neighbor of the lady, while at work with a mowing machine, left his seat to disentangle a tuft of grass from the knives; while so engaged something occurred to start the horses, when the man's fingers were cut off. This incident being mentioned at the lady's dinner table, suggested the idea of obviating the danger. Study of the machinery followed, and in a short time the lady devised a plan, by which the cutting bar is thrown out of gear the moment the driver's weight is removed from the seat; and upon resuming his place it is again thrown into gear and ready for cutting. This is in brief, the sum of the patent—simple, exceedingly simple; but, exceedingly valuable also. Our authority states that one of the most extensive firms engaged in the manufacture of agricultural implements in New England, has examined and approved of the patent, and that it will be generally adopted the coming season.

The Origin of the Locomotive.—In the matter of priority of invention in, or rather of attempts at land propulsion by steam, the French may well claim to be our *devanciers*, and we do not think that any true Englishman will be inclined to grudge them this honor.

The first steam carriage seems to have been made by a Frenchman, Cugnot, in 1760, that same marvelous year which witnessed the birth of Napoleon I, Wellington, Humboldt, Mehemet, Ali, Lord Castlereagh, Sir E. I. Brunel, Cuvier, and the first patent of Arkwright, the first patent of Watt, as also some other events almost as great in their eventful influence on the present era. An engine made by Cugnot is still in existence in the Conservatoire des Arts et Metiers at Paris. It has a copper boiler, very much like a common kettle without the handle and spout, furnishing with steam a pair of 13-inch single acting cylinders. The engine propels a single driving wheel which, is roughened on its periphery. Altogether, this engine bears considerable testimony to the mechanical genius of its inventor. It was unsuccessful, having got overturned once or twice on the very bad roads then existing in France, and it was put one side. It was stated, however, that arrangements were made in 1801, to put it to work in the presence of Napoleon Bonaparte. The departure, however, of Napoleon for Egypt, prevented the trial—a circumstance which recalls Fulton's subsequent unsuccessful negotiations with Napoleon for aid in attempting marine propulsion by steam.

Watt, then, in 1784, patented a locomotive engine, the boiler of which was to be "wood," hooped like a beer barrel. Watt, however, had not much faith in steam carriages, and he objected to the attempts made in this direction, in 1784, by Wm. Murdoch, his very able assistant. The miniature engines made by Murdoch in that year is still carefully preserved at Soho. Careful and elaborate researches, such as those lately made by Mr. Zerah Colburn into the history of the locomotive, seem to more and more confirm the existing impressions as to the great part done by Trevethick in the introduction of the locomotive engine.

Fish as Food.—There is much nourishment in fish, little less than butcher's meat, weight for weight: and in effect it may be more nourishing, considering how, from its soft fiber, fish is more easily digested. Moreover, there is in fish a substance which does not exist in the flesh of land animals, viz: iodine—a substance which may have a beneficial effect on the health, and tend to prevent the production of scrofulous and tubercular disease, the latter in the form of pulmonary consumption, one of the most cruel and fatal with which the civilized, the highly educated and refined are afflicted. Comparative trials prove that, in the majority of fish, the proportions of solid matter—that is, the matter which remains after perfect desication, or the expulsion of the aqueous part—is little inferior to the several kinds of butcher's meat, game or poultry. And if we give attention to classes of people classed as to equality of food they principally subsist on, we find that the ichthyophagus classes are especially strong, healthy and prolific. In no class than that of fishers do we see so large families, handsome women, more robust and active men, or greater exemptions from maladies.

A tunnel for prospecting, draining, and mining purposes, is to be run under the city of Austin, by the Mount Prometheus Tunnel and Mining Company.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

SAN FRANCISCO, SATURDAY MORNING, June 3, 1865.

The loan demnnd for money has not improved, bnt large sums on deposit are being used for various purposes. Rates of interest remain nnchanged, ruling steadily at 1½ ₱ cent. per month, in Bank, and nt 2@3 ₱ cent. in tbe open market. It has been evident, for sometime past, that capitnl available for loans, in the ordinary course of business, exceeds tbe requirement, and tbe recent withdrawnl of nt least one million dollars loaned npon mining share collaterals, adds to the plethora in Bank. It is, however, more than prohable that a large amount of capital bitberto employed for stock purposes, will flow into the same cbannel again as soon as tbe affairs of certain leading companies have assumed such shape and consistency as are adapted to inspire a little more confidence.

Receipts of trensure from tbe interior, from Saturday last to the 30th ultmo., amounted to $850,000; making an aggregate of $4,950,000 for tbe month of May, as against $4,750,000 in tbe same period of last yenr. During the past mouth, the Bnnch Mint, in tbis city, bas taken $2,200,000 for coinage.

Bullion was in fair request yesterday, for sbipment, and gold bars ranged nt 830@840. Silver is ruling at ½ ₱ cent. premium to 2 ₱ cent. discount, the former for selccted bars.

Legal Tender Notes have been very inactive this week, and in rather less favor, receding from 78½c to 77¼c, and closing at 77⅜ bid, 77½ nsked. The U. S. Quartermaster of this Depnrtment, has disbursed some $2,500,000 since the 20th ult. Of tbis sum, about $400,000 has beeu absorbed in subscriptions to the 7-30 Government loan, during tbe past week.

The Mining Share Market has been dull, and transactions at the Board show n lighter business than for a montb past. An advance, however, has been established in certain stocks; and, in others, more stendiness may be noted, with less disposition to renlize upon the part of some holders. Tbe late decline, it is now conceded, arose from the diminished productiveness of nearly every claim upon the Comstock during the month of April, and since then; together with the unfavorable financial condition of several Companies npon tbe payment of their last dividends. If these dividends had not been declared when it wns found tbat the ore was yielding badly, nnd actual earnings did not justify them, and the funds used for tbat purpose had been applied to the extinguisbment of a real indebtedness, tbe public would now feel less skeptical as to the alleged improvement in the cbaracter of the ore being sent to a number of mills, and would also have more faith in the future management of certain companies.

Gould ⁊ Curry has met with trifling sales this week, at $1,500, closing at $1,525 bid, $1,550 asked. A dividend of $50 per foot will be declared for the month of May. No outside mills have been employed recently, and the Company's mill alone, has reduced nbout 3,000 tons of ore and tailings during tbe past 30 days. Since January last tbnt establishment bas successfully treated some 15,000 tons of ore and tailings, at an average cost of $12½ per ton. This expense included hauling from tbe mine, and all otber outlays incident to tbe reduction of the ore.

Yellow Jacket opened at $1,310, declined to $1,240, rallied to $1,320 on Wednesday, and sold yesterday nt $1,350@$1,400—in all, 67 feet cbanged bands. The product of this claim, for tbe montb of April, amounted to 7,918 tons, and yielded to tbo Company less than $50,000 net. Dnring tbe past week, the middle body of ore, in the lower level, has shown some improvement, and 225 tons are now being taken mainly from this portion of tbe mine, averaging some $40 per ton. More care bas been taken in the selection of ore recently, and a better net yield is anticipated. The indebtedness of this company has been materially reduced since the 20th ult.

Savage is in less favor, nnd declined from $1,240 to $1,160, selling yesterday at $1,190. Within tbis range 32 feet were dealt in. From the upper levels this mine is now yielding an average of 115 tons of orc per day, averaging ahont $36 per ton. The receipts of bullion, for the past month, amounted to about $75,000 less thau in tbe preceding 30 days, but tbe indebtedness of the company is being curtailed, and explorations continue at a depth of 80 feet from the lower level, with, it is said, flattering indications.

Belcher fell from $1,025 to $890, rallied to $925 bid, and closed last evening at $930. A dividend of $17 per share, or $51 per foot, is payable, to-day, out of the earnings of the past month, nnd it is said that a small surplus bas been left in the treasury of the company.

Crown Point dropped from $760 to $650, rallied to $740, and is now held at $750; small sales were made at these rates. The company are giving steady employment to two mills, and are regularly in the receipt of bullion. Some 220 feet of prospecting drifts have been driven during tho past montb.

Alpha was sold, to the extent of 10 feet, at $700, and is now offered at $650. We have no later advices from this claim.

Ophir bas attracted less attention, and 11 feet were sold, declining from $500 to $440, and closing at $475. The work of development continues with vigor, and bodies of oro, found recently, may, it is thought, lead to something still more encouraging. The company are out of debt, and have a small surplus on hand.

Hale & Norcross advanced from $415 to $450, declined to $420, rallied to $430, and closes nt $425 asked. The incline has attained a perpendicular depth of 700 feet from the surface, nnd drifting has begun towards tbe lode. $675 per foot have thns far been levied upon this stock. Empire Mill & Mining Company has met witb no sale tbis week.

Potosi receded from $250 to $150, rallied to $210, and sold yesterday at from $205 to $202. Within this range 238 feet were dealt in Chollar declined from $260 to $160, advanced to $215 on Wednesday, nnd closed at about $215 bid. Some 94 feet, in all, cbanged hands. The joint product of tbese two claims does not exceed 40 tons per day, and, so far as we are informed, no new developments have been made recently.

Minerva bas met with a decided decline, owing to the decision of the jury, in the suit of tbe Bullion vs. this Company, adverse to the latter, nnd fell from $250 to $15, rallying, however, yesterday, to $40.

Imperinl bas been very largely dealt in, and 2,066 sbares chnnged hnnds, receding from $165 per share to $120, advancing to $142, and selling yesterday at $145@139. Recent advices, as to the appearance of the drifts in the 525 feet level, are said to be favornble, but n late crusbing, at one of tbe company's mills, resulted in some dissappointment, owing, it is stated, to nn imperfect treatment of the ore.

Uncle Sam declined from $145 to $85, rallied to $105, and sold yesterday at $120. Bullion rose from $140 to $150, fell to $120, rallied at $140, and closed at $135.

Burning Moscow declined from $43 to $38, nnd closed at about $40. Sierra Nevnda was sold at $14½; Daney at $20, and Wide Wcst at $6.

The recorded sales of stock, since Snturday last, amounted, in tbe aggregate, to $647,257.

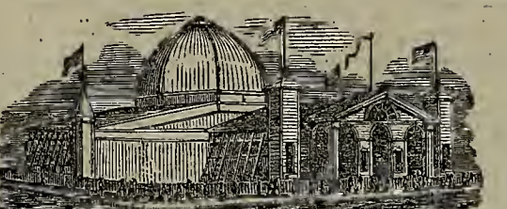
The Male and Female Voice.

A late number of the *Musical Review* contains an interesting article on the voice and song, showing the difference between the male and female voice. Nature alone has given the human being two distinct kinds of voice, that are again divided and subdivided. It says:



In order to make the causes of this clear, let us east a glance at one of the simplest laws of tonal vibration. For example—we take a string of a certain length and strength, and give it a certain tension. If with a bow, or simply with the finger, we set it in motion we shall perceive a tone, which we shall call C. Here is another string of the same strength and tension, but only half the length of the last. If we set it in motion, it also gives out the tone C—but not the same; it is finer, higher, more penetrating. If we now strike both strings, we perceive this difference more distinctly and recognize that peculiar unison which musicians term octaves. In order to give forth the high C, the short string is obliged to give forth twice as many vibrations as the long one, but in the same time. Without knowing or willing it, we obey the same laws of vibration. Ask a young girl to sing an air that has just been sung by a man, and in the same key; she will sing it an octave higher. The finer and more delicate voice of a woman makes more vibrations in the same time than that of a man, and is higher from that cause. The woman is the octave, the half of the man. The good citizens who call their wives their "better halves" are right, musically speaking. The octave exists through the might of the right divine.

In the male and female voice there are again two principal subdivisions, man sings tenor or bass, woman contralto or soprano. The contralto is the octave of the bass, the soprano the octave of the tenor. Each of those voices has its own peculiar character that does not depend merely on compass or on fullness, but rather on tone coloring. A union of these is seldom found. Exceptional voices appear, which are called mezzo-soprano among women, and baritone among men.

THE TREDEGAR IRON WORKS.—These celebrated works, of which we have heard much since the breaking out of the rebellion, are situated in the northern part of the city of Richmond, and cover about ten acres of ground. A newspaper correspondent writing from Richmond, just after the occupation of that city by our troops, says: "There are a variety of buildings on the property, consisting of a carpenter and pattern shop, sixty by eighty feet; additional blacksmith shops, a large shed for fitting up car works, etc. In the latter building there is a great variety of gun carriages ready for use. I noticed the gun-wagon, the wheels of which were ten feet in diameter, and the tires weighed one thousand and eighty-one pounds each. Another rolling mill has lately been completed, but not yet used. It is an extensive building, four stories in hight, and capable of turning out an immense quantity of work. The latter mill is owned by the State; but the company have leased it. Anything, from a needle to a locomotive, can be manufactured at the Tredegar Works, and it is a prize for the Union army, which, if the war should continue, will prove of inestimable value. The superintendent resides on the premises, in a regular brick dwelling-house erected for his particular use. The chagrin of the Jeff Davis sympathizers have at the non-destruction of these works known no bounds. It is particularly mortifying for them to know that the most valuable portion of their city is laid in ashes by the hands of their own kith and kin, and which if standing would be of little benefit to us, as it was nearly all private property, which would have been respected under any circumstances, and the very spot of all others, the Tredegar Works, which is really the great prize of the war, should be left intact, and fall a prey to Northern vandals." An attempt was made to destroy these works at the time of the evacuation, but it proved unsuccessful.

THE CROPS.—The Marysville *Appeal* says, speaking of the crops north, that the fields of grain, wheat and barley, growing along the Feather river, for twenty miles are truly astonishing. Some of them are ripe and ready for the sickle, while others, nearer the river and on lower ground, are growing more thriftily. A few fields have been cradled, but a majority still stand ready for the harvester. Sutter county will turn out this year an immense yield of grain. Mr. R. Sneath, of this city, who recently visited Red Bluff, reports the crops in fine condition along his route of travel.

THE FIFTH INDUSTRIAL FAIR

OF THE MECHANICS' INSTITUTE OF SAN FRANCISCO,

To be Held in the Mechanics' Institute Pavilion in August, 1865.

The Mechanics' Institute having determined to hold their Fifth Industrial Fair during the coming season, the Executive Committee would respectfully invite all persons desirous of exhibiting Machines, Manufactures, Agricultural Implements, Horticultural Products, Minerals, Ores, and Works of Art, to make application immediately, in order that the proper space may be allotted them.

The Exhibition will be open to the public on Thursday, the 17th day of August, at 10 o'clock A. M.

The general management of the Fair is entrusted to an Executive Committee, consisting of the officers of the Institute.

No contracts or agreements will be recognized unless made by the authorized agents of this Committee.

A competent person will be in attendance at the Pavilion to receive and register all goods designed for exhibition, and will receipt therefor.

Contributions of Machinery and other articles that require long time to prepare for exhibition, will be received from the 15th of July to the 2d of August.

Articles for exhibition that require large space may be entered on or before the 20th day of July, and space will be allotted to the exhibitor on or before the 2d of August.

The Picture Galleries will be ready for the reception of Pictures, Embroideries, Wax and Fancy Work of all kinds, on the 1st of August, when space will be allotted.

The Committee will be prepared for the reception of Fruits, Flowers, Agricultural and Horticultural Productions, and design to have the tables so arranged that the best display possible can be made in this department, and every effort will be made and care taken to preserve their freshness, so that exhibitors may receive full credit for their productions. Those wishing space on these tables should engage it at an early day. There will be space reserved for additions in this department during the Fair.

The several transportation companies, as on former occasions, have, with commendable liberality, consented to transport articles intended exclusively for exhibition free of charge, and Messrs. Wells, Fargo & Co., in like manner, will take charge of them.

The Committee have the fullest confidence that the coming Fair will not only be the most complete and varied in its character, but will also be more attractive than any previous exhibition of this kind on this coast.

No pains or expense will be spared to give the contributors satisfactory opportunities in the spacious pavilion of the Institute for the display of their contributions, and to furnish whatever may be necessary to make the Fair an institution where those who frequent it may be both pleased and instructed.

All articles forwarded should be labeled "For the Industrial Exhibition," San Francisco.

All communications to be addressed to C. S. HIGGINS, Corresponding Secretary.

EXECUTIVE COMMITTEE.

CHARLES M. PLUM, President.

JOSIAH MOULTON,	D. A. MACDONALD,

P. B. DEXTER, Secretary.

MINING AND SCIENTIFIC PRESS

PATENT AGENCY.

For the Pacific Coast.

OFFICE OF THE MINING AND SCIENTIFIC PRESS—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through the medium of our associate in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented, the applicant will be enable to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analagous device; or some other invention for a similar purpose, but partially resembles the applicant's in the construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of government that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we cause a thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have excess to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by farther efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimentions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely: DEWEY & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first instalment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicant's case has been rejected, he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oil-cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or corresponding style of ornamental relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most thorough character and our charges are very moderate.

Patent Office Fees, and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner; that is to say, before the labor is performed for which they are to be received in payment.

The following is the Government tariff of fees established by law:

On every application for a design, for 3 yrs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	30
On every application for a patent, for seventeen years...	15
On every caveat.....	10
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunc tion from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, No. 505 Clay street, corner of Sansome, San Francisco.

Just and True Economy

IN MINING ADVERTISING.

The Proprietors of the MINING AND SCIENTIFIC PRESS would call the especial attention of MINING SECRETARIES, TRUSTEES and SHAREHOLDERS, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The PRESS enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the PRESS is less by ONE HALF than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the PRESS, making the mining interest their especial care, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the PRESS or some other paper.

6th. Many copies of the PRESS are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of peculiar and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is too obvious. With this view we have established our rates at only fair, living prices, believing that a journal like ours, untrammeled by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Advertisements in the columns of the PRESS, after their first insertion, are arranged alphabetically. Our present list is equalled only in one instance by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

LAST, BUT NOT LEAST.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the PRESS shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:

Removal.

The Office of the MINING AND SCIENTIFIC PRESS has been removed to the old printing stand known as Waters Bros. & Co., southwest corner of Clay and Sansome streets, opposite the Niantic Hotel (being one block south of our former location), where we may now be found, with more commodious apartments and an extensive JOB PRINTING OFFICE.

San Francisco, April 10th, 1865.

THE PENNSYLVANIA OIL REGION AND THE ORIGIN OF THE OIL SUPPLY.

According to the best accounts we have been able to collect, the Pennsylvania oil region proper is an elevated valley, having the Alleghany mountains for its eastern and southern boundary, while a high rolling ridge of country extends quite around, from the northeast to the southern edge of this valley. The Ohio river breaks through this ridge near the eastern boundary line of that State, while the extreme northern portion of the ridge is washed by the waters of Lake Erie. This valley is about 130 miles long by perhaps 75 in breadth. The city of Pittsburg is located a little south of the center. The stratification of the valley appears to form a basin rising in every direction from the center, its geological depth being from 500 to 800 feet deeper than its topographical depth. In the early days of the settlement of this country numerous salt springs were noticed in the ravines, at various points around the circumference of the basin. Wells were dug and bored to obtain this salt water for the purpose of manufacturing salt for the use of the settlers. Gradually these wells began to give out—those in the upper portions of the ravines first, and as other wells were dug, lower down, they also in time ceased to produce salt water, many of them yielding a dirty, useless fluid, more or less impregnated with oil and gas. The salt business appeared to be coming to an end, as every new well had to be sunk lower down in the basin, and of course they had to go deeper to find the salt water. It began to be observed, moreover, that the flow of oil in the wells first sunk, or those highest up toward the edge of the basin, increased as the salt water disappeared from the wells next below. Matters had arrived at this point when the useful purposes of this oil, which was ruining the salt business, and disgusting the people, began to be made known. The dawn of a new business was at once apparent and Yankee genius was not slow to turn it to profitable account. We all know the result.

A somewhat novel and ingenious theory of the production and probable continuous supply of oil in that region has been founded upon the facts above given. It is assumed as a fair inference that the oil and salt water occupies the same interstices or seams in the rocks; and in addition to the physical reason that the oil—a lighter fluid—should be found upon the top of the water; the further fact of the giving out of the salt water, by years of pumping and flowing, and the subsequent appearance of the oil in the same wells is a further and conclusive evidence that such must be the case. The fact seems to be established that the oil there, at least, is found in the upper portions of the strata, *around the border of the basin*, while the center thereof is filled with salt water and covered by an impervious stratum, which prevents the descent of the fresh or surface waters. Were this last not so, the salt would long ago have been diluted to water, quite too *fresh* for the economical manufacture of salt. Now for the "theory," which we copy from the Pittsburg *Gazette*:—

We believe oil to be the product of a vast process of distillation perpetually going on far down below the surface of the earth, under the operation of its internal heat. To sustain and render plausible this idea will require a glance at the structure of the crust of our planet. In the earlier ages, when this crust was thin and weak compared with what it is now, its volume was somewhat greater than at present, owing to the well known law that nearly all bodies when hot are larger than when cool. It followed necessarily that as the earth cooled it shrank, and as it contracted in volume, its outer crust would remain the same, and of course become corrugated into elevations and depressions, mountains and valleys. Any one who has noticed a withered and shrunken apple, covered with wrinkles—miniature mountains and valleys—has seen the effect of which we are speaking.

This corrugation of the earth's crust—already rigid—would necessarily break the rocks, and leave extensive chinks beneath the crests of the ridges and mountains. It is through these chinks or breaches that oil, in the form of vapor, ascends from the hot depths beneath, which, condensing as it reaches the cold rock near the surface, percolates through the fissures of the rocks in which it is found, and flows down into the valley or basin, until it rests upon the salt water, as before intimated.

If this be so—if this great natural distillery is perpetually at work—no apprehension need be felt that the supply will ever fail. Indeed, it may be that the letting out of the gas, and the drawing off of some of the oil, only stimulates the process of condensation, and allows the vapor (hitherto enormously compressed) to expand and fill up the spaces thus relieved more rapidly than ever before.

This brings us about to the verge of human knowledge. From what this oil is distilled in the dark and deep caverns in which it is elaborated, we do not pretend to guess; but its odor, in short everything about it, indicates that it is driven into its vapory form by the action of strong heat.

LANGSHORE'S BREACH LOADING CANNON.

Our Mokelumne Hill correspondent of the 13th ult., sent us quite a full description of Langshore's breach loading cannon, a recent California invention for the more rapid and convenient discharge of cannon; particularly those in stationary use at fortifications, and on ship-board. Mr. L., who is now in this city, called at our office on Thursday, and exhibited his model, somewhat modified from that described by our correspondent. This modification has been made at the suggestion of an eminent military gentleman connected with the harbor defense of this city. The change consists in doing away with much cumbersome machinery which was at first attached to the working of the gun, and for which room could not well be spared in the limited space allowed in forts or on ship-board. The gun, as it now stands, consists of an ordinary cylinder, with a square opening, or mortice, passing entirely through the breach at right angles with the direction of the bore. A double or treble chamber piece is made to fit this opening, into which it is slid, so that when the chamber containing the charge is brought squarely behind the barrel, like the chamber of a revolving pistol, it is fired; after the discharge, the chamber piece is moved further along, until the next chamber is brought to proper position for discharge, when it, in turn, is fired. While the second is being discharged, the one first fired protrudes through the mortice-like opening across the gun, and is loaded in the open air, by merely placing the charge into the recess, without ramming. The chamber piece is now slid back, and the first one discharged a second time. The chambers are thus made to alternate; while one is being fired the other is being loaded. They can be made with two or three, or more chambers. The movements are effected by a simple arrangement of screws and cranks, not liable to get out of order. In the first model, the chamber piece was brought up to the barrel by screws; in the one now before us, it is brought to its position, and held there by a wedge, which is worked by a screw; an arrangement also suggested by the military gentleman above alluded to, and which makes the gun more effective and less liable to get out of order. The invention evidently possesses much merit, and appears to present a decided advantage over any breech loading cannon heretofore introduced.

MINING IN IDAHO.

There is very good reason for believing that Idaho is destined to become a most important and permanent mining region. Thus far operations there appear to have been conducted upon a sound basis, with very little of the speculative feature so characteristic of most new mining localities. The geography of the country appears to be very little understood by most Californians, although, if we are to judge by the great numbers that are wending their way thither from this city and from Washoe, our people will soon have a pretty thorough and practical knowledge thereof.

Owyhee is the center of much mining activity, and we learn from the Jacksonville *Sentinel*, that not less than 400 lodes have already been located there. It is said that there will be six or eight mills at work in that vicinity during the present season. At Ruby city about 800 men are congregated, and there are several families there. A school has already been established at Silver City. The Placer mines are chiefly confined to Jordon creek, and will employ about 300 men this season. The gold is valued at about twelve dollars per ounce. The quartz mills in operation, at last accounts, were the Mexican, Moore & Co.'s mill, the Minah and the Sinker mills.

From Pioneer city we also receive highly encouraging accounts. The Elkham Co., have three ledges, with rock, said to assay from $200 to $800 per ton. The company will have a ten-stamp mill under way by the first of August.

The King & Muller ledges, now owned by Messrs. Jackson & Bibb, according to the Idaho *World*, is developing very rich, and will prove lucrative to the owners. The Bartee company are still running their tunnel, with good prospects of striking it rich. The Union, Sucker, and various other ledges will be thoroughly tested. These ledges, together with the rich placer mines of Pioneer district, will, in the course of a year or two, add greatly to the resources of Idaho Territory.

A singular phenomenon recently took place in the Payette river. All at once the water seemed to quit running, almost, and continued so for near thirty-six hours, and then suddenly came in one volumne—supposed to have been caused by an avalanche.

It is said that a vein of nearly pure alum has been discovered somewhere on the Little Salmon river. It is supposed to be the same vein that was discovered by parties engaged in opening the trail from the Boise Basin to Lewiston in 1863.

THE Contra Costa *Gazette* says: The season has been very favorable for hay, and the crop now being secured is abundant. Other parts of the State have been equally favored, and in some counties the yield is one-half more than an average. There is every probability that the price of this article will soon be reduced to a very moderate figure.

GOD IN NATURE.—The whole world is like a looking-glass, which whole and entire represents the image of God, and every broken piece of it, and every little shred of a creature doth the like.

A BOOK FOR MINERS.—G. Kustel's California and Nevada Processes. For sale by A. Roman & Co., and advertised in to-day's paper.

SINALOA, MEXICO—A REMARKABLE MINE AT ROSARIO.

We have before us a private letter, dated at the Rappahoe mine, State of Sinaloa, Mexico, from which we are allowed to glean the following facts. The past season in Mexico, has been an unusually wet one—more rain having fallen than for any similar term for the past thirty years. The cotton crop has been greatly injured in consequence. The rainy season there generally commences about the middle of June and continues until the first of November. The country is very favorable for raising corn, which can be produced for about twenty-five cents per bushel. It can generally be bought at about this figure at harvest time; but it is often worth five or six times that amount before the next harvest comes in. This advance in the price grows out of the indolent character of the native inhabitants. Their only care is for the present. Hence they will realize from their crops as early as possible, reserve an insufficient store for themselves, and be compelled to buy before the next crop comes in at an exorbitant price. Experience, even the most dire, appears to have no effect upon them. They are indeed less provident now than they were two centuries ago. There are about 800 Americans in the State of Sinaloa, mostly engaged in mining.

They have a church in every village of any considerable size. In the town of Rosario, they have one which cost $50,000, and which was built by imposing a tax of twelve and a half cents upon each eight dollars which was taken from the Tajo mine. This tax would indicate a gross yield from the mine of $3,200,000, during the time occupied in the building of the church. The town is described by our correspondent as about as large as Petaluma, in this State; about one-half of it is built directly over the excavations made in working the mine. These excavations underlie an extent of about 100 acres of surface ground. This mine is quite as remarkable for the singularity of its location as for the immense amount of treasure which it has yielded. It is situated in the midst of a plain, or table land, has no regular course, but appears to occur in a concentrated mass of about the area mentioned, and extending downward into the bowels of the earth. It has been worked about two hundred years, and some idea may be formed of the amount of silver which has been taken out, from the fact above alluded to, that upwards of $3,000,000 were realised during the short period of time occupied by the building of the Rosario church. Work upon the mine has recently been suspended in consequence of the seizure, by the Government, of all the powder belonging to the company, and the impossibility of obtaining a new supply. The pump is kept running, in order to keep the mine free from water and ready for the commencement of operations at the earliest practical moment. This pumping is a very heavy expense, as the mine, from its peculiar location, makes a large amount of water.

VERY PROPER LEGISLATION.—We learn from the London *Mining Journal*, that Lord Kinnaird has introduced a bill into Parliament, making the use of the "Man Engine" obligatory in all the deep mines of Cornwall. The requirement is made, not from the belief that climbing is injurious to the miner; but for the reason that after working moderately in the drift, through the watch, the miner exerts himself so much by going up the ladders, as to induce at times, profuse perspiration, from which he is quite apt to catch cold as soon as the cold surface air strikes him. Asthma is a very common complaint among miners, induced by the use of the ladders. When a miner comes up by the man engine he arrives at the surface as cool as when he left the drift. Would it not be well for miners in California and Nevada to take a hint from the above, and observe more care in the sudden change from the warm air of the mine to the cold air at the surface. Much sickness is doubtless engendered from carelessness in this particular, which is attributed to other causes.

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

GUN COTTON FOR THE CALIFORNIA MINES.

We have already noticed the arrival in this city of an invoice of gun cotton, designed for introduction, for blasting purposes, into the mining districts on the Pacific Coast. A practical exhibition of its value in blasting will be given some time during the coming week, probably at some point on Telegraph Hill, near Montgomery street, of which due notice will be given in the city. We have been shown some samples of this cotton, both in the yarn, and also put up in cartridge form ready for use. It is prepared after the manner of a rope made upon a wooden core, which is subsequently withdrawn, leaving the rope hollow; the size of the rope being graduated to that of the different bores which it is desirable to make in the rock. The rope is cut into sections of from five to eight inches in length. These sections are bound around, near their extremities, with small wire, very much as specimens of the Atlantic tegegraph cable have been put up for exhibition, one or more of these sections being used for a charge. Their convenience for handling is much superior to that of powder, except when that article is put up in the form of cartridges. Our present purpose is merely to state the fact that an invoice of gun cotton has already arrived in this city, and will be speedily and practically introduced to the notice of our miners, who will thus be enabled to judge from ocular demonstration of its comparative value with other explosives. Circulars will be prepared and issued at an early day, giving all needed information, etc, of which due notice will be given through the columns of the MINING AND SCIENTIFIC PRESS, and other papers. We propose speaking more fully upon the matter next week, at which time we shall give some interesting particulars with regard to its introduction for mining purposes in Europe. It should be borne in mind, that the article now introduced here is that proposed after the process invented by the Austrian Baron Lerk, an entirely different article from the preparation first introduced to European notice, and subsequently condemned for its uncertain and dangerous properties.

FRENCH SCREWED BOOT MACHINE.—The first machine for making the celebrated French screwed boots, ever seen in California is now in operation at the store of Koenig Brothers, No. 608 Washington street, having arrived from Paris by the last steamer. The French screwed boot has been sold here by this firm for twelve years, but never before manufactured in California. The machine is a great curiosity, and equals any invention ever patented in Connecticut. The screws are made from brass wire, which is cut with the thread and screwed into the leather at the same time by simply turning a crank, and are cut, of any length, by a simple "turn of the wrist." The sole and heel of a boot can be completely fastened so as never to give ont, by this process, in less than three minutes, and with the aid of this machine, it is claimed that boots can be made to order as cheaply as ready-made boots can be imported.

TO MINE OWNERS.

REDUCTION AND SMELTING WORKS ON A SUFFICIENTLY large scale, where Ores of every kind can be thoroughly treated, so as to extract therefrom the precious metals, have long been wanted in California.

The Undersigned is desirous of erecting such works to meet the demand, provided sufficient encouragement can be obtained in regard to the quantity of work which may reasonably be looked for.

I have sufficiently proven, in my former smelting works, on Bryant Street, where I worked the richest of the Ophir ores to within Two and One-Half per cent. of the Assay, that I was acquainted with Metallurgy previous to my recent travels and experience in Europe, where I have built, during my sojourn there of nearly three years, many Reduction Works, thereby proving that I am capable of working ores by any and all known processes, whether by Smelting or Amalgamating, or other methods best adapted to the nature of the ore to be worked, and as close to the assay as can be done anywhere in Europe.

Mine owners wishing quantities worked as cheaply and effectively as can be done by sending it to Europe, will address the undersigned. Parties wishing to erect Quartz Mills, or other Reduction Works, can be furnished with Plans, Estimations, and other useful and necessary information as to the best mode of extracting the precious metals.

Address **J. MOSHEIMER,**

No. 338 Montgomery street, Corner of California street, San Francisco. 23v9tfq

THE OIL INTEREST.

We have a report from Mattole Valley, Humboldt county, that the Union Mattole Petroleum Company, on the lower north fork of the Mattole river, had obtained oil in such quantity as to lead to a pretty definite conclusion that they were just upon the point of reaching a flowing well. The works of this company under the charge of Mr. George Noble, had reached a depth of eighty-five feet, with constantly increasing indications of oil, when on going to the well one morning, a few days since, the workmen were surprised at finding several feet of oil in the same. The sand-pump was repentedly sent down, and came up full of oil every time. All the spare vessels about the premises were filled with the fluid, and the workmen were still unable to effect any decrease of oil in the well, whereupon the foreman proceeded overland to this city with all possible dispatch to procure barrels, in which to save the oil, before going any deeper. We understand that the barrels will go forward by Monday's steamer, on receipt of which pumping will be immediately commenced. A large flow is confidently anticipated when the pumps are put in operation, if not at the present depth, at least within a very limited increase of depth.

There is little doubt but that the oil is found as described; but whether it will be continuous can be determined only on trial of the pump. The well yields no water, and the oil is of a dark brown color, and apparently of a very fair quality of crude petroleum. We shall probably be more fully advised upon the matter on the return of the steamer from her next trip.

From Colusa we learn that Capt. Rowe's boring operations are progressing favorably. A depth of fifty-five feet had been reached on Wednesday of last week. From Santa Barbara we learn that at latest dates the well of the Eastern Petroleum Company was down 170 feet, with flattering indications. The company boring near Los Angelos have received their tubing, and were to have resumed boring operations on Monday last. The Adam's Well Company, at Mount Diablo, have their steam machinery nearly ready for running. When everything is ready the work of boring will be pushed forward as rapidly as possible, until the oil question, for that locality at least, is thoroughly demonstrated.

H. J. BOOTH. GEO. W. PRESCOTT. I. M. SCOTT.

UNION IRON WORKS!

Corner First and Mission streets,

SAN FRANCISCO.

ESTABLISHED IN 1849.

HAVING INCREASED OUR FACILITIES IN EVERY Department, we are now prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, Screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

Engines.

Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter.

Boilers.

Locomotive, Fine, Tubular, Upright, Cylinder and Cornish.

Amalgamating Machinery.

Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Coleman's Crushers, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs.

Qartz Screens.

We are prepared to furnish both punch and slotted, from the finest to the coarsest numbers, of the best quality Russia Iron.

All work done in the best manner at the lowest cash prices.

21v10 **H. J. BOOTH & CO.**

MARTIN & CO.,

Office, Stevenson House,

Corner California and Montgomery streets (up stairs).

PURCHASE OF COPPER ORES,

Assaying eight per cent. and upwards of Copper to the ton.

We will make advances upon Ores of Copper.

San Francisco, Post Office Box 1259, 21v10

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarknble success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reword which must follow the faithful performance of their trusts, will take eare to afford Inventors every advnntage to be secured to them through a competent and responsible agency upon this coast.

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms nre less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

DEWEY & CO.,
Publishers and Job Printers,
Office Mining and Scientific Press, San Francisco.

CHICO AND IDAHO STAGE LINE.

U. S. MAIL ROUTE.

FROM CHICO TO RUBY CITY.

Fare, $50!

Provisions and Blankets packed free of charge.

STAGES LEAVE CHICO EVERY MONDAY, WEDNESDAY and FRIDAY, via Susanville and Surprise Valley, for Ruby City, in the Owyhee and Boise mines.

This is the nearest and best route connecting California and Idaho, being less than one-third the distance by way of Oregon.

Passengers should secure Tickets before leaving San Francisco or Sacramento, so as to get off on the first stages departing after their arrival at Chico.

Fare from Sacramento to Chico, $11.

Having had long experience in this line, I am prepared to fill orders promptly and at low rates. No. 107 Leidesdorff street, between California and Sacramento, San Francisco. 21v10 1m

THE HAMMER QUARTZ MILL.

[PATENT APPLIED FOR.]

This Machine is now complete and ready for sale. In constructing it, our aim has been to produce a light, cheap and economical Crusher—one adapted to mining on a small as well as on a large scale.

The elementary principle on which it operates is that of the stamp—the only one really reliable and economical.

But the stamp has many serious disadvantages, among which are its great weight and small velocity; the great power required to run it; difficulty in feeding properly; imperfect discharge, and the necessity of crushing wet, or the annoyance from dust in crushing dry.

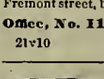
All these difficulties are obviated in our machine, and the percussive blow of the stamp retained, with the further advantage of its being a drawing or grinding one.

We give to our hammers such absolute or relative weight and velocity as we choose—just such as to effect their purpose and no more—thus securing the qualities of the natural hammer blow.

The feed is self-adjusting and uniform, and as fast as the ore reaches the required degree of fineness (which depends upon the fineness of the screen or sieve used), it is instantly discharged, so that there is no packing of the ore under the hammers.

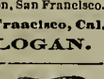
The mill crushes dry, with no more dust than that incident to feeding, which is trifling.

As the only support of the mortar is a single post set into the ground, the machine can be put in place at slight expense.



The size now being built weighs about 1,800 pounds complete; the heaviest piece not weighing over 275 pounds. It is driven by half a horse-power, and crushes from three to ten tons per day of twenty-four hours per day, according to the character of the rock and the fineness to which it is reduced.

PRICE,.....$800.



Larger ones will be furnished if desired.

We invite an inspection of the Mill now in operation adjoining the Foundry of DEVOE, DINSMORE & CO., on Fremont street, between Market and Mission, San Francisco.

BAD MANAGEMENT IN MINING.—As evidence of the lack of judgment often noticed, in mining, the case of the Sonoma company has recently been cited. This company ran a tunnel, last year, to tap their ledge and after penetrating the hill a great distance, concluded they would stop and run an incline to explore the vein, which they ought to have done in the first place. In their explorations they have found that they went in their tunnel sixty feet beyond their ledge. The point where the tunnel pierced it happened to be in a clay seam with but little quartz, Some stockholders believing that to be the ledge, advised prospecting it, but were overruled by the Superintendent. It has lately been prospected by an incline from the tunnel and some excellent ruby silver found. It is said there is now a fine vein of this ore. We believe that poor mining is the father of most of the wild cat that has damaged the business.

BARLEY SPECULATION.—One hundred tuns of barley were recently sold by A. C Campbell, dealer in produce, on Main street, in Grass Valley, to be delivered between the 1st of August and 15th of September, 1865. The purchaser of the barley, E. B. Freeman agrees to pay for said barley, delivered in Grass Valley, the sum of fifty dollars per tun.

A FARMER near Uniontown, Pennsylvania boasts that he has raised the most extraordinary sheep on the continent of America. He is a well formed animal, half Spanish and half Silesian, three years old, and has on him a fleece, the fibres of which are eighteen inches in length, and proportionately heavy.

THE interview between General Grant and Secretary Seward, in the apartment of the latter, was very affecting. Mr Seward grasped General Grant's hand, exclaiming, "Thank God you are alive!"

THE BEST BOOK

—FOR—

MINERS, PROSPECTORS AND MILLMEN.

Nevada & California Processes

—OF—

SILVER AND GOLD

EXTRACTION,

For General Use,

BY GIUDO KÜSTEL,

Mining Engineer and Metallurgist—Formerly of the Ophir Works,

IN ONE HANDSOME OCTAVO VOLUME.

SYNOPSIS OF THE WORK.

PART FIRST.

Chapter 1st—Treats of the methods of recognizing silver and gold ores, and contains a "Systematic Proceeding" for their determination by blowpipe analysis readily learned and practised, and is a reliable and accurate guide.

Chapter 2d—Is a description of gold and silver ores, describing many interesting occurrences in minerals belonging to the Comstock, Gold Hill, Humboldt, and Arizona Mining Districts.

Chapter 3d—Describes the requisites and approved methods for testing and assaying—with Illustrations.

Chapter 4th—Speaks chiefly of the extraction of gold, especially the amalgamation treatment of ores in batteries, pans and arrastras; and also the extraction of gold by chlorination.

Chapter 5th—Is replete with valuable information on the extraction of silver, including divisions of processes employed. The behavior of chemicals by the wet process; the same when calcined—with valuable hints to attendants roasting ores. Full description for the cold and melting processes, etc.

Chapter 6th—Makes mention of the most modern utensils and machinery, such as pans, agitators, furnaces, etc., with comprehensive diagrams.

PART SECOND.

ON GENERAL METALLURGY.

Chapter 1st—Treats of many species of argentiferous ores; the dry assays of rich and poor ores; also, the same by the humid and dry methods.

Chapter 2d—Presents a clear and comprehensive description of the extraction of silver either by melting or amalgamating process—its dissolution and final precipitation—with divisions of the principal modes of extraction employed.

Chapter 3d—This last chapter gives full and precise formulas for the extraction of the metals in the dry way; the various modes employed in Europe and South America.

The "Amalgamation in pans" with chemicals, or dry method by calcination or roasting ores, forms the most valuable portion of the work; the same being thoroughly and distinctly described and explained, and particularly designed for the treatment of ores in Lower California, Arizona, Mexico, and other mining districts where argentiferous lead ores abound. No less valuable and important are the practical descriptions and illustrations of cupellation and refining of silver, and concentration of the same in lead, by the Pattinson and other processes.

This Work is invaluable to Prospectors, Miners, Metallurgists and Mill-men throughout the Pacific States, containing valuable formulas for the treatment of ores and minerals, expressly prepared in an authentic manner and a plainly written style, for persons engaged in mills in California, Washoe, Lower California, etc. It is also valuable to prospectors and miners unacquainted with mineralogy, having a full and clear chapter on Blowpipe Assays and Tests.

EUROPEAN

METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

A TOAD IN LIMESTONE.—It is stated that in the Dyke House Quarry, West Hartlepool, England, a living toad has been found embedded in the solid rock, twenty-five feet from surface, and eight feet from any spring water vein. The toad is described as palo when first seen, gradually darkening, on exposure, to a fine olive brown; it barks when touched, and was exhibited at the Hartlepool Natural History Society.

No improvement that takes places in either of the sexes can hossibly be confided to itself; each is a universal mirror to each; and the respective refinements of the one will alwnys bo in reciprocal proportion to the polish of the other.

The New York *Tribune* says farm laborers are plenty now at $15 and $20 per month. A good many rebel deserters and repentant rebels are being hired to work on farms in Pennsylvania. Government furnishes transportation and the farmers pay them $8 and $10 a month.

THE Emperor Napoleon contemplates making a systematic tour, which will last several years, through the French provinces, in order to introduce the Imperial Prince to his future subjects. The south of France is to be the first stage, and to have its turn this year.

LEWIS COFFEY & RISDON,

Steam Boiler & Sheet Iron Works.

THE only exclusively Boiler Making establishment on the Pacific Coast owned and conducted by Practical Boiler Makers. All orders for New Work and the repairing of Old Work, executed as ordered, and warranted as to quality.

Old Stand, corner of Bush and Market streets, opposite Oriental Hotel, San Francisco.

UNASSESSABLE.

First National PETROLEUM COMPANY.

Organized under the Laws of the State of California, March, 1865.

CAPITAL STOCK,....$1,000,000,

Divided into 200,000 Shares of $5 Each.

OFFICERS:

HON. J. E. VINTON.....President.
A. W. STRATTON.....Treasurer.
D. S. CUTTER.....Secretary.

TRUSTEES:

J. E. VINTON, W. H. TOBEY, A. W. STRATTON, W. B. EWER, M. C. CONROY.

Office: At W. H. Tobey & Co.'s Petroleum Agency,
Room No. 28 Government House,
SAN FRANCISCO.

This Company issues none but UNASSESSABLE STOCK. This Company's ground is developed by a special fund, derived from sales from a reserved amount of stock set apart by the Company for such a purpose

This Company has secured SIX HUNDRED AND FORTY ACRES OF LAND, in Tulare county, California, in the midst of one of the most valuable oil regions on the continent. One of the largest flowing oil springs in the State is located upon the ground, over a large extent of which oil may be found by sinking open shafts to the depth of ten or fifteen feet.

The lands were selected by the same parties who assisted in locating the well known "Buena Vista Petroleum Company," which company it adjoins on the south.

One hundred gallons of crude oil have already been received in this city from the Buena Vista Company, upon whose grounds a flowing well has been struck at a depth of fifty feet. This oil may be seen at the laboratory of Prof. E. Bunoist, at 643 Third street, San Francisco. From it has been distilled as pure an article of kerosene as can be found in the city, samples of which can be seen at the office of the "FIRST NATIONAL PETROLEUM COMPANY," Room No. 20 Government House, in this city.

DEVELOPMENT.

The Company has already entered into a contract with parties who will start the coming week with suitable tools for developing the property. The Company rests its claim to confidence solely upon the intrinsic value of its property, and feels the utmost assurance that its development will realize their most sanguine expectations, and enable it to take rank, at an early day, as a dividend-paying concern.

We would again call the attention of the public to the fact that when you have purchased stock in this Company there can be no assessments coming upon you—that no "freezing out" can be attempted by large stockholders upon smaller ones.

THE CONTINGENT FUND,

From which all expenses are paid, is derived from sales of a reserved fund of ten thousand shares of unassessable stock, whose par value is $50,000. The prospectus and map of the Company's location can be had on application to the Secretary, at his office, Government House, corner Sansome and Washington streets, San Francisco.

Only two thousand shares of the contingent fund is now the only stock in the market for sale, and the proceeds derived therefrom will be appropriated for the purpose designed. The Company are sanguine that they will be able to produce oil in this market from a flowing well upon their claim inside of six weeks, upon which accomplishment there is every reason to believe that the stock will be worth its par value.

San Francisco, April 7, 1865. 14v10

Our Advertising Circular Will be furnished free on application to this office. Its contents are as follows:

Corporation Assessment Law of California.
Economy in Mining Advertising.
Table for Advertising Assessments on Saturdays.
Calendar for 1865-1866.
Information about Obtaining Patents.
Table of Distances on the Pacific Coast.

Let it be Known.—When any of our readers respond (by letters of inquiry or by the purchase of articles) to advertisements found in our columns, they will confer a favor, not only upon us, but upon the advertiser, by mentioning the fact of having seen the notice in our paper

"Say, why should man for thirst be given
If not for wine bestowed by Heaven
To quench such drought as mine?
Without it, I'm a fish on land,
A barren heap of parching sand—
Then give me joyous wine."—*Tribillet.*

Delicacy of flavor, exhilaration without intoxication, and every other desirable property belonging to the rightly fermented Juice of the Grape, are to be found in the "Gerke Wine," from the celebrated Bosquejo Vineyard, Tehama county.

There is no wine produced in California that can bear comparison with this, and it would be difficult to find a European wine, of the same class, that can surpass it.

The vintage of 1862 is now offered for sale, in quantities to suit, by the Agent of the vineyard,

A. S. LOWNDES,

Basement of the New York Hotel, southwest corner Battery and Commercial streets, San Francisco. 20v10-4y

NOTICE TO MINERS.

THE UNDERSIGNED WILL SELL

MINING STOCK

In Incorporated Companies and Unincorporated Mines, in San Francisco District and in El Dorado District, Arizona Territory. It is confidently asserted and believed by most practical miners that Arizona is the richest mining country in the world. Recent developments of these mines are now attracting the attention of capitalists, who have already erected several mills, and more are going there soon. Now is the time to invest to advantage, and obtain the rise that must soon follow. Those wishing to purchase soon can do so on most liberal terms, by calling on MR. RODNEY CLARK, 338 Montgomery street (room No. 11), San Francisco, or on H. C. SKINNER, San Jose, California.

N. B.—Freight all the way by water at a cost of 4½ cents per pound.

H. C. SKINNER,
San Jose, California.

San Francisco, April 27, 1865. 17q10

JOHN TAYLOR & CO.,

—IMPORTERS AND DEALERS OF—

ASSAYERS' MATERIALS,

Druggists' & Chemists' Glassware,

Photographic Stock, Etc.

512 and 514 Washington Street,

SAN FRANCISCO.

WE are receiving direct from MESSRS. LADD & OERTLING (London) and BEEKER & SONS (Antwerp, Belgium) their superior

ASSAY AND BULLION BALANCES,

And from France and Germany, as well as the Eastern States, FURNACES, CRUCIBLES, MUFFLES, BLOWPIPE CASES, GOLD SCALES, CHEMICAL GLASSWARE, and every article required for ASSAY OFFICES, LABORATORIES, etc. We have given this branch of our business particular attention, to select such articles as are necessary in the development of the mineral wealth of this coast.

A Full Assortment of DRUGGISTS' GLASSWARE and DRUGGISTS' SUNDRIES, ACIDS and CHEMICALS, constantly on hand.

San Francisco, March 16, 1865. IIv10-tf

Machinery.

A CARD.

MR. H. S. JACOBS, formerly of this State and Oregon, adopts this method of calling the attention of his old friends and customers to the fact that he has established himself permanently in the city of New York, having, since his residence in California, perfected and secured by letters patent his celebrated WHEEL-MAKING MACHINERY, which not only materially reduces the cost of manufacture, but makes a much more durable and finished wheel than by the old method. These facts are simply attested by the large and increasing demand for Wheels made by this machinery, as well as by the numerous testimonials furnished by parties who have purchased and tested them. Having made large contracts for timber, selected expressly for this purpose by a gentleman who has had an experience of upwards of thirty-five years, and whose entire attention is devoted to the selection of stock connected with this branch of industry, and having had myself an experience of eleven years in manufacturing in California and Oregon, and being personally acquainted with the sizes, styles, material and wants of these states, I feel the most entire confidence in being able to supply the trade with a better and cheaper article than can be had from any other source, and in whatever quantity may be desired, having on hand at present one of the largest and best assorted stocks of Omnibus, Truck, Cart and Light Wagon Wheels, of all sizes, together with a varied assortment of Hubs, Spokes, Felloes, Bent Rims, Shafts, Poles, etc., to be found in the country—all made under my own supervision and of the very best material and workmanship. All descriptions of well-seasoned Timber kept constantly on hand and supplied in any quantity. Orders for material of all and every kind pertaining to Wagon manufacture will be filled promptly for cash on delivery.

Address, THE JACOBS PATENT WHEEL-DRESSING MACHINE AND WHEEL COMPANY, 99 Wall street and 145 and 147 Bank street, New York.

N. B.—Those desiring peculiarity of style in Hubs, Felloes, Spokes, etc., can be accommodated, and will receive our careful attention by sending samples of the same. [20v10

NOTICE.

The undersigned having purchased the EXCLUSIVE RIGHT in and for the State of California, for the

Manufacture and Sale of

WINHAM'S
PATENT HOSE COUPLING,

Hereby caution all parties against the manufacture or purchase of the above Hose Couplings, except through us, as any infringement will be prosecuted to the full extent of the law.

PRESCOTT & SCHEIDEL,
Marysville Foundry.

March 31st, 1865. 13v10-3m

SALMON'S
PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this amalgamator, and assayed by Miller & Lunbaum, at Austin, Nevada:

	No.	Fine		No.	Fine
Assay	250	943	Assay	300	990
Assay	285	941	Assay for Chapman		989
Assay	286	940	Assay Water Rock		966
Assay	291	950	Assay Water Rock		993
Assay			St. Helena Ledge, W. D.		966

These, including a hundred other batches, were all worked to within fifteen per cent., and some to within ten per cent., of the assay. Parties interested will find it their advantage to call and see the above machine in operation.

Manufactured at the San Francisco Foundry, San Francisco, California, by

J. & W. C. SALMON,

To whom all orders should be addressed. 15

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,

At the Novelty Iron Works, Nos. 37 & 39 Fremont street. 15-1m

BAUX & GUIOD'S
Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

Lapidaries' refuse, Refiners' ashes, Jewelers' sweepings, purchased or worked for a percentage. Ores and tailings worked or assayed at reasonable rates.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8

FARRAND'S
Oscillating Amalgamator,

RECEIVED THE

ONLY PREMIUM

AWARDED FOR AMALGAMATORS

At the Recent Industrial Fair
OF THE
Mechanics' Institute of San Francisco.

Committee of Awards.

O. Belden, W. T. Garratt, H. P. Wakelee,
O. Gosl, Geo. Jonsson, C. M. Rancurt.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall, and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, whilst the loss by trituration is comparatively nothing.

4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.

5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY.

W. D. FARRAND, Inventor,
R. L. OGDEN, Agent, SAN FRANCISCO.

S. E. corner Montgomery and California streets.

16v9

HANSCOM'S CRUSHERS,

Made in sizes suitable for Breaking Quartz for Batteries; Rock for macadamizing or concrete; Copper Ore for sacking, sampling, or concentrating; also, for crushing Quartz for Arastras and Orinders. The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water, or Steam Power. For further information address W. W. HANSCOM.

I Golden State Iron Works, San Francisco.

HUNT'S PATENT
Circular Sweep Horse-Powers,

For running Churns, Washing Machines, Grindstones, pumping water, sawing wood, and other light machinery. Price, $100, at the Factory.

HUNT'S PATENT SELF-REGULATING TREAD HORSE-POWER is superior to any machine of the kind in the market. Price, with Governor, all complete to set to work, at the Factory, $300. Manufactured by

E. O. HUNT,

17v10 28 Second street, San Francisco.

NOTICE TO MINERS.
NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Frellerg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast, amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. **B. FAUCHERY,** Engineer,

24v9

WM. BRUCKNER'S
Furnace for Roasting Ores.

Now in Operation at 416 Market street.

This Furnace, which is portable, and can be carried on muleback, undertakes to roast without employing any labor whatever for the operation of stirring, which is accomplished by machinery that may be driven by steam or any other motor. It consists of an iron cylinder, which, being suspended by chains, in rotating mixes and stirs the ore, by an internal apparatus, quicker and more perfectly than can be done in any other furnace hitherto known in metallurgy. It can be applied to any kind of ore, and the rapidity and perfectedness of its operation, the great saving in fuel, and the entire saving of the labor usually required for stirring the ore, together with the small cost of constructing it, renders this furnace a most

Economical and Practical Invention.

The Furnace may be had of two sizes—one being nine feet in length and holding fourteen hundred pounds, and the other six feet in length, and holding eight hundred pounds. One horse power is required to drive the machinery of the larger sized furnace, and three-fourths of a horse power for the smaller size. Parties wishing to erect such furnaces will please communicate to

W. BRUCKNER,

5v10 No. 416 Market street, San Francisco.

BLAKE'S
QUARTZ BREAKER

Is now extensively used for breaking hard masses of

Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

CALIFORNIA, AUSTRALIA,
WASHOE,
ENGLAND, FRANCE,
—AND—
THE ATLANTIC STATES.

These Machines, or circulars containing further information regarding them, may be obtained of the undersigned. Address,

BLAKE & TYLER,

Box 2077 San Francisco Post Office.

CHAS. T. BLAKE, Idaho City. E. TYLER, Michigan Bluff. WM. P. BLAKE, San Francisco.

4v10

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, but one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the **PACIFIC FOUNDRY,**

1v10 San Francisco.

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th.

Illustrated in the Mining and Scientific Press, April 9th, 1864. HEPBURN & PETERSON.

HUNT'S
IMPROVED WIND-MILL,

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order, they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN
HORSE POWER
For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

E. O. HUNT,

No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

ATWOOD'S
Self-Regulating Windmill.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,
SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

HENDY'S
IMPROVED BLOW-PIPE.

This Convenient Helpmeet
—TO THE—
ASSAYER, CHEMIST, DENTIST, JEWELLER, PROSPECTOR AND MILLMAN,

Can now be procured, at the Patentee's price, by sending your orders, by mail or otherwise, to the

Office of the Mining and Scientific Press.

This article was more fully mentioned in the Press of April 15th, 1865. Since that time, however, Mr. Hendy has made a further improvement by attaching a rubber hose between the mouth-piece and the pipe, enabling the blower to change his position without disturbing the direction or constant accuracy of the current on the object upon which it is turned. The main portion of the blow-pipe is made with a joint, at which a valve is placed, which is opened when the operator blows and closed immediately when he ceases. By this arrangement the little bag or bladder is readily filled at a single breath, and with very little exertion. When so filled, a continous current of air is forced from the nozzle of the pipe by the mere contractive force of the gutta percha. This force is uniform until the air is very nearly exhausted. The current may be easily varied or entirely cut off by gently pressing the fingers upon the neck of the bladder above the nipple to which it is attached.

Price, Complete.....$5.00.
CALL AND EXAMINE SAMPLES.

Sent by mail, if desired. Address

DEWEY & CO.,

16v10-tf No 505 Clay street, San Francisco.

New Mining Advertisements.

Arizona Consolidated Mining Company, Eureka District, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 29th day of April, 1865, an assessment of fifty cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company.

Any stock upon which said assessment shall remain unpaid on Saturday, the 3d day of June, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Wednesday, the 21st day of June, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

JOHN Q. ADAMS, Secretary.

Office, No. 6 Montgomery Block, San Francisco. my6

POSTPONEMENT.—The advertisement of stock delinquent on the above Assessment is hereby postponed. All assessments remaining unpaid on Friday, June 9th, 1865, will be advertised as delinquent on Saturday, June 10th, 1865. The sale of delinquent stock is hereby postponed until Wednesday, June 28th, 1865. By order of the Board of Trustees.

je3 JOHN Q. ADAMS, Secretary.

Caldwell Gold & Silver Mining Company, Cave District, Tulare County, Cal.

The Annual Meeting of the Stockholders of the Caldwell Gold & Silver Mining Company, will take place at the office of the Company, No. 432 Montgomery Street, San Francisco, on Tuesday, June 20th, 1865, at 7½ o'clock, P. M., for the purpose of electing Trustees to serve for the ensuing year, altering of by-laws and such other business as may come before the meeting. By order of the Board of Trustees. M. O. ELMORE, Secretary.

San Francisco, June 3, 1865.

Evening Star Gold and Silver Mining Company, Trinity District, Humboldt County, Nevada.

Notice is hereby given, that at a meeting of the Stockholders of the Evening Star Gold & Silver Mining Company, will be held at No. 410 California Street, San Francisco, on Monday, the 19th day of June, 1865, at 3 o'clock P. M., of that day for the purpose of altering the by-laws of the Company and of transacting other necessary business. A punctual attendance is requested, as subjects of importance to the Company will be presented. By order of the Board of Trustees.

N. DUPERU, Secretary.

Office, No. 710 Sansome street, San Francisco. je3

And in accordance with law, and an order of the Board of Trustees, made on the 25th day of April, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at public auction, at the office of E. X. Field, No. 605 Clay street, room 6, San Francisco, on the 10th day of June, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

S. LOCKE, Secretary.

Office No. 605 Clay street, corner of Montgomery, San Francisco. je3

Kelsey Gold and Silver Mining Company, Kelsey District, El Dorado County, Cal., San Francisco, May 31, 1865.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 30th day of May, 1865, an assessment, No. 10, of 30 cents per share was levied upon the capital stock of said Company, payable on the 31st day of May, 1865, in United States gold and silver coin, to the Secretary, at the office of the company, No. 16 Drum street.

Any stock upon which said assessment shall remain unpaid on Saturday, the 1st day of July, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 15th day of July, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

S. C. GARDNER, Secretary.

Office at Messrs. Bemis & Elson's, 16 Drum street, between California and Sacramento streets. je3

Keokuk Gold, Silver and Copper Mining Company, Clayton District, Contra Costa County, California.

Astonishing Illegality of Mining Advertising!

The amount of mining corporation advertisements now being published in certain daily papers of this city in an illegal manner, and containing plain and gross violations of the recent Act concerning assessments of corporations, is really astonishing.

ADVERTISING IN SUPPLEMENTS has been decided by the Courts of the State of New York (after whose code the laws of California were framed,) as absolutely void; and we have the best of reasons for cautioning every prudent company against that class of advertising. Furthermore, there are continually numberless errors or discrepancies occurring, through MISAPPREHENSION OF THE LAW, on the part of advertisers.

We do not aim to raise unneccessary alarm, but simply perform our duty in admonishing parties interested against the storm of retribution, which is most surely awaiting the success of such companies as are now pursuing informal transactions, whether the same occur through carelessness, duplicity or ignorance.

The original bill for levying and collecting assessments, as first introduced before the last Legislature, we denounced as outrageous; as amended and passed, the Act is obnoxious and cumbersome to the mining community, and is rapidly preparing an enormous feast for the "legal fraternity" of this coast. Although very rigid, the law is no less specific in its main features, and when once minutely understood, its illiberal requisitions are very plain.

MINING COMPANIES and others connected with the Mining Interests of California, will find all possible desired information in the *Mining and Scientific Press* of San Francisco which is an ably edited Journal, smartly handled, and well up to the times. The Mining Companies of California, are awake to the advantages of having their Mining Notices, comprising Assessments, Dividends, Elections, &c., concentrated in the advertising columns of one Journal, as we notice in the issue of the *Press* of May 7th, there are no less than seven pages of this interesting matter.—*U. S. Mining Journal Railroad and Financial Advertiser, New York.*

BLASTING POWDER.

EDWARD H. PARKER,

No. 224 California Street,

Agent of the

Hazard Powder Company.

EUREKA Patent Blasting Powder COMPANY.

Office, southeast corner Battery and Commercial streets. Room No. 9, with San Francisco Chemical Works.

CHAS. A. JAMES.....AGENT.

For underground blasting in Tunnels, Mines, etc., this Powder possesses very great advantage—on account of it giving out scarcely any smoke after the blast. By using the same quantity in bulk as the gun blasting powder, you produce a much greater effect. 10v10dy

1852. 1865.

Thirteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

Liberal Terms to Clubs.

THE GOLDEN ERA is furnished to CLUBS at the following rates: Three Copies, one year, Ten Dollars; Five Copies, one year, Fifteen Dollars; Ten Copies, one year, Twenty five Dollars. An extra copy will be forwarded, free, for one year, to the person sending a club of five or ten subscribers.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the GOLDEN ERA, from advance sheets; simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

IN THE GOLDEN ERA,

"THE FAIR LILIAS;"

Or, "LIFE IN DEATH,"

A New Story, by PIERCE EGAN, Author of "The Poor Girl," "The Flower of the Flock," "Lady Maud," "The Snake in the Grass," "Such is Life," Etc.

PIERCE EGAN is undoubtedly the most fascinating and attractive Novelist of the age. His stories are eagerly sought for, read and admired by hundreds of thousands in England and America. "THE FAIR LILIAS; or, Life in Death," surpasses, in exciting interest and thrilling situations, all of the productions of the celebrated author, and is Pierce Egan's masterpiece.

THE GREAT SERIAL,

"OUR MUTUAL FRIEND,".....By Charles Dickens.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

A Valuable California Invention.

IMPORTANT TO OPERATORS AND DEALERS IN PETROLEUM, ETC.

CALIFORNIA

HERMETICALLY SEALED BARRELS,

—FOR—

TRANSPORTING CRUDE PETROLEUM, KEROSENE, AND OTHER VOLATILE OILS.

WM. H. TOBEY & CO., having purchased the sole right of the United States and Territories to make and vend the above Barrels for the period of ten years, we are now prepared to enter into contracts with parties desirous of using such Barrels, to furnish the same, in any quantity, and at short notice. Samples may be seen at the office of Wm. H. Tobey & Co., Petroleum Agency, Room 28, Government House, San Francisco.

The above invention consists of a simple but effective preparation, which can be applied as a coating to any ordinary barrel of pine or hard wood, by which the same is rendered perfectly impervious to the most volatile substance known, thus rendering an ordinary barrel quite as safe a receptacle for Petroleum as a metal case, and at far less cost. Orders received as above by

PETROLEUM

ASPHALTUM and COAL

AGENCY.

WM. H. TOBEY & CO.,

San Francisco,

Having completed their arrangements with parties in the East, as well as those on this Coast, are now prepared to enter into the purchase, sale or lease of

PETROLEUM, ASPHALTUM AND COAL LANDS,

—ALSO—

COPPER, GOLD AND SILVER MINES,

LIBERAL advancements made on CRUDE PETROLEUM and COPPER ORES. We are also prepared to supply all BORING APPARATUS, TUBING, STEAM ENGINES, BARRELS for shipping Oil, etc., of the latest and most approved patterns.

Experienced Artesian Well Borers and help furnished at the shortest notice.

Persons at a distance wishing to send orders, receive information or subscribe for stock, will save time and money by communicating with us, as we are in constant communication with the most reliable houses and experienced persons at the East.

Parties owning Oil Lands or knowing where there are good prospects, will do well to write or meet us at our office. All communications strictly confidential.

We have now on our Books descriptions of Oil Lands which were selected by experienced chemists. Companies will be organized and incorporated under the laws of the State of California.

Samples from all PETROLEUM and COAL MINES on the Pacific Coast are solicited for our Laboratory.

Best of references given.

☞ *All business connected with Petroleum and Coal Mines* will be promptly attended to. Address

W. H. TOBEY & CO., Box 2031 Post Office.

Office, Government House, corner of Washington and Sansome streets. 11v10

The Monthly Series of the MINING AND SCIENTIFIC PRESS comprises the Nos. of our weekly edition for each month bound in pamphlet style, forming monthly parts similar to those issued by the publishers of *Harper's Weekly*. They are very convenient for preservation and reference, and make a handsome work to send to your intelligent friends in distant mines, in the East, and in foreign countries. Price, 50 cents per copy, or $5.50 per annum.

U. S. 7-30 LOAN.

By authority of the Secretary of the Treasury, the undersigned has assumed the General Subscription Agency for the sale of United States Treasury Notes, bearing seven and three-tenths per cent. interest per annum, known as the

SEVEN-THIRTY LOAN.

These Notes are issued under date June 15th, 1865, and are payable three years from that time in currency, or are convertible, at the option of the holder, into

U. S. 5-20 Six Per Cent.

GOLD BEARING BONDS.

These Bonds are now worth a premium of nine per cent. including gold interest from November, which makes the actual profit on the 7-30 loan, at current rates, including interest, about ten per cent. per annum, besides its EXEMPTION FROM STATE AND MUNICIPAL TAXATION, WHICH ADDS FROM ONE TO THREE PER CENT. MORE, according to the rate levied on other property. The interest is payable in currency, semi-annually, by coupons attached to each note, which may be cut off and sold to any bank or banker.

The interest amounts to

One cent per day on a $50 note,
Two cents per day on a $100 note,
Ten cents per day on a $500 note,
Twenty cents per day on a $1,000 note,
One dollar per day on a $5,000 note.

Notes of all the denominations named will be promptly furnished upon receipt of subscription. This is

The only Loan in Market

now offered by the Government, and it is confidently expected that its superior advantages will make it

THE GREAT POPULAR LOAN OF THE PEOPLE.

Less than $300,000,000 of the loan authorized by the last Congress is now on the market.

This amount, at the rate at which it is being absorbed, will all be subscribed for within four months, when the notes will undoubtedly command a premium, as has uniformly been the case on closing the subscriptions to other Loans.

In order that citizens of every town and section of the country may be afforded facilities for taking the Loan, the National Bank, State Banks, and Private Bankers throughout the country have generally agreed to receive subscriptions at par. Subscribers will select their own agents, in whom they have confidence, and who only are to be responsible for the delivery of the notes for which they receive orders.

JAY COOKE,
Subscription Agent, Philadelphia.

March 25, 1865. 17v10-3m

ADDENDUM.

PER OVERLAND TELEGRAPH:

PHILADELPHIA, May 17, 1865

Second Series all sold. Commenced on Third Series. Two Hundred and Thirty Millions (230,000,000) precisely like other two Series, except dated 15th July, and Government reserves the right to pay six per cent. in Gold instead of 7-30 Currency. **JAY COOKE,**
Subscription Agent, Philadelphia.

HELMBOLD'S

FLUID EXTRACT BUCHU

For Non-Retention or Incontinence of Urine, Inflammation or Ulceration of the Bladder or Kidneys, Diseases of the Prostrate Gland, Gravel, Brick Dust Deposits, Dropsical Swellings, Orgaulic Weakness, Debility, Female Complaints, Etc.

H

HELMBOLD'S

FLUID EXTRACT BUCHU

—AND—

Improved Rose Wash

Will radically exterminate from the system Diseases arising from Habits of Dissipation, *at little expense, little or no change of diet, no inconvenience or exposure*; completely superseding those *unpleasant and dangerous remedies, Copaiba and Mercury*, in curing these diseases.

C

USE HEMBOLD'S

FLUID EXTRACT BUCHU

In all Diseases of the Urinary Organs, whether existing in MALE OR FEMALE, *from whatever cause originating, and no matter of how long standing*. It is pleasant in its taste and odor, IMMEDIATE in action, and more strengthening than any of the preparations of *Bark or Iron*.

Those suffering from *Broken Down or Delicate Constitutions, procure the Remedy at once.*

The reader must be aware that however slight may be the attack of the above diseases, it is certain to affect his *Bodily Health, Mental Powers and Happiness*. If no treatment is submitted to, Consumption or Insanity may ensue.

All the above diseases require the aid of a diuretic.

Hembold's Extract Buchu

IS THE GREAT DIURETIC.

L

HELMBOLD'S

BIGDLY CONCENTRATED

Compound Fluid Extract Sarsaparilla,

For purifying the Blood, removing all diseases arising from excess and imprudence in life, chronic constitutional diseases arising from an impure state of the blood, and the only reliable and effectual known remedy for the cure of Scrofula, Scald Head, Salt Rheum, Palms and Swelling of the Bones, Ulcerations of the Throat and Legs, Blotches, Pimples on the Face, Tetter, Erysipelas, and all scaly eruptions of the skin, and beautifying the COMPLEXION.

M

NOT A FEW

Of the worst disorders that afflict mankind arise from the corruption that accumulates in the Blood. Of all the discoveries that have been made to purge it out, none can equal in effect HELMBOLD'S CONCENTRATED EXTRACT OF SARSAPARILLA. It cleanses and renovates the Blood, instills the vigor of health into the system, and purges out the humors which make disease. It stimulates the healthy functions of the body, and expels the disorders that grow and rankle in the Blood. Such a remedy, that could be relied on, has long been sought for, and now, for the first time, the public have one on which they can depend. Our space here does not admit of certificates to show its effects, but the trial of a single bottle will show to the sick that it has virtues surpassing anything they have ever taken.

B

Two tablespoonsful of the Extract of Sarsaparilla, added to a pint of water, is equal to the Lisbon Diet Drink, and one bottle is equal to a gallon of the Syrup of Sarsaparilla, or the decoction as usually made.

The above Extracts are prepared on purely scientific principles—in *Vacuo*—and embody the full strength of the ingredients entering into their composition. A ready and conclusive test will be a comparison of their properties with those set forth in the U. S. Dispensatory.

O

HOW TO USE THE REMEDIES.

In Diseases of the Blood, Humors on the Face, or any and every part of the body, use Extract of Sarsaparilla, applying to Pimples and all external Humors or Eruptions the Improved Rose Wash.

Use the Extract Buchu for all diseases requiring the aid of a diuretic, except those of the Urinary Organs, such as Gonorrhœa and Gleet; in these use the Extract Buchu, and inject with the Improved Rose Wash.

L

☞ THESE EXTRACTS HAVE BEEN ADMITTED TO USE IN THE UNITED STATES ARMY, and also are in very general use in all the STATE HOSPITALS AND PUBLIC INSTITUTIONS throughout the land, as well as in private practice, and are considered as invaluable remedies.

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

BALDNESS

Can be Cured!

MR. M. HOWARD, from Virginia City, Nevada, has discovered and patented an ENTIRELY ORIGINAL ARTICLE for producing a fresh, vigorous and permanent growth of the Hair upon the human scalp, where total or partial baldness has prevailed. His remedy is the assistant of Nature itself, enabling the Hair to penetrate the scalp and sustain its growth. It is simple and harmless in its application, but powerful in its good results, reproducing hair upon bald heads of long standing and preventing the hair from falling out. Mr. Howard will show interested parties calling upon him, at his room, No. 15, second floor, 522 Montgomery street, San Francisco, a long list of affidavits, containing positive recommendations of his RESTORATIVE from prominent residents of Virginia City who have been benefitted by its application. 17v10

Gun Cotton.—In our notice of the gun cotton which was exhibited at this office last week, we inadvertently neglected to mention that it was imported at the order of William H. Clary, a practical miner, well known in Calaveras and other counties in this State. It was manufactured under the inspection of Barron Lenk, according to the well known Austrian process, by which it is especially prepared so as to be quite free from alteration, and consequently, from danger which would otherwise exist of spontaneous combustion. We hope soon to be able to lay before our mining friends the results of some experiments which will soon be made, in this State, with regard to the value of this preparation for mining purposes.

J. Ross Browne, has arrived at Reese River, and we may soon expect something from his pen in regard to the mines of that region.

[Written for the Mining and Scientific Press.]

THE GEYSER SPRINGS OF CALIFORNIA.

It was a wild region upon which we now entered. Steep down slid the huge mountain sides to depths unknown; for they were concealed by the thick-set pillars of the fir and redwood. Opposite rose heights equally abrupt. Over this almost level line appeared the blue wall of a chain beyond, with scattered peaks in the dimmest distance. The intervening gorges ran from east to west; but that immediately below us was divided by a narrow partition wall which crossed two chains. Over this wall our road lay. The golden tint of the wild oats was gone from the landscape. The mountains were covered to the summits with dense masses of furze, chamisal, laurel and manzanita, painting them with gorgeous purple, yellow, brown and green. For the hundredth time I exclaimed "What a country for an artist!" On the sharp comb of the transverse connecting wall over which we rode, there was barely room for the trail (since enlarged for the stage road). Originally, it was next to impossible; but several thousand dollars expended in cutting chaparral, blasting rocks and bridging chasms, have made it secure and easy. The silence and solitude was complete. Straight down went the trail, descending a thousand feet, within the distance of a mile. Superb as was the forest around, lovely as were the glimpses into the wild dells on either side, we scarcely heeded them, but looked forward at every turn for the inn which was to bring us comfort. At last we saw the river near at hand. The trail, notched over the sides of its banks, almost overhung it. Ha! here is a row of bathing shanties. A thin thread of steam puffs out of a mound of sulphur-colored earth opposite. "Is that all?" followed by the reflection, if there was nothing else here, we have still been a thousand times repaid.

But here comes the hotel, at last! It was a pleasant, frame building, of two stories, surrounded (above and below) by spacious verandas. Patriarchal oaks shaded the knoll on which it stood, and the hot river roared over the volcanic rocks below. A pipe, carried from a spring across the river, supplied the baths to which we were conducted, and which have a temperature of about 100 degrees. In their vicinity is a cold spring, strongly impregnated with iron. The bath and a lunch restored us so thoroughly that my wife declared her ability to make the tour of the Geysers at once. In the meantime the proprietor had arrived with Captain Davidson, who had been endeavoring to ascertain the temperature of the stream.

As Mr. Taylor's visit was one of pleasure, while that of Captain Davidson was made for the furtherance of science, we purpose to give the details published by the latter gentleman, but will preface his description by that of Forest Shepheard, Professor of Geology in Western Reserve College, Ohio, who was the first scientific traveler that visited the Geysers, in 1851. He went by Napa, accompanied by some hunters named B. F. Briggs, P. and J. Cyrus. After traveling northwest through almost impenetrable thickets, he reached the summit of a high peak, early on the fourth day. He writes:

"On the west we saw the vast Pacific; on the south, the bay of San Francisco, Mount Diablo, Sonoma and Napa valleys; on the east, the lofty range of the Sierra Nevada; while on the north, almost immediately at our feet, there opened a chasm, apparently formed by the rending of the mountains, in a direction from east to west. The sun's rays had already penetrated into the narrow valley, and so lighted up the deep defile, that from a distance of four or five miles we distinctly saw clouds and dense columns of steam rapidly rising from the banks of the little river Pluton. It was now the 8th of February; the mountain peaks in the distance were covered with snow, while the valley at our feet wore the verdant garb of summer. It was with difficulty we could persuade ourselves that we were not looking down on some manufacturing city, such as Pittsburg or Wheeling, until by a tortuous descent, we arrived at the spot where at once the secrets of the inner world opened upon our astonished senses. In the space of half a mile square we discovered from one to two hundred openings, through which the steam issued with violence, sending up columns of dense vapor to the height of from 150 to 200 feet, like our largest ocean steamers, and gradually diminishing to engines of one to two-horse power. The roar of the larger tubes could be heard for a mile or more. The sharp hissing of the smaller ones is still ringing in my ears. Many of them would work spasmodically, precisely like high-pressure engines, throwing out occasional jets of hot scalding water some twenty or thirty feet, endangering the lives of those who rashly ventured too near. In some places the steam and water came in contact so as to produce a constant *jet d'eau*, or spouting fountain, with a dense cloud above the spray, affording vivid prismatic hues in the sunshine.

"Numerous cones are formed by the accumulation of various mineral salts and a deposit of sulphur crystals with earthy matter, which often hardens into crusts of greater or less strength and thickness.

"Frequently the streams of boiling water would mount up to the top of the cones with violent ebullition. Some of the cones appear to be immense boiling cauldrons, and you hear the lashing and foaming gyrations beneath your feet as you approach them. It is then a moment of intense interest. Curiosity impels you forward—fear holds you back; and while you hesitate, the thin crust under your feet gives way, and you find yourself sinking below. The writer on one occasion heard the rushing of water under his feet. He struck down with an ax, which on the first blow went through into the deep whirlpool the length of the helve. He withdrew it and cut an opening, which revealed a stream of angry water, boiling intensely, and of unknown breadth and depth. He enlarged the opening until the stream was seen to be five or six feet in breadth, leading on indefinitely into the dark caverns beneath the mountain.

"At the base of the cones, in the bottom of the ravines, and in the bed, and on the north bank of the river Pluton, springs, almost innumerable, break out, of various qualities and temperatures, from icy coldness up to the boiling point. You may here find sulphur water precisely similar to the celebrated *White Sulphur* of Green Briar county, Va., except its icy coldness. Also, red, blue, and even black sulphur waters, both icy cold and boiling. Also, pure, limpid, hot water, without any sulphur or chlorine salts; calcarious hot waters, magnesian, chalybeate, etc., in almost endless variety. Every natural facility is afforded for either vapor, shower, or plunging baths. Where the heated sulphureted hydrogen gas is evolved, water appears to be suddenly formed, beautiful crystal of sulphur deposited (not sublimed as by fire), and more or less sulphuric acid generated. In some places this acid was found so strong as to turn black kid gloves almost immediately to a deep red. Where the heated gas escapes in the river Pluton, such is the amount of sulphur deposited, that the whole bed of the stream is made white for one or two miles below, similar to the White Sulphur Spring in Virginia. From numerous experiments made here, and in the mountains of Virginia, we are confident that all sulphur springs possess a high temperature after descending below the cold surface water. Notwithstanding that the rocks and earth in many places are so hot as to burn your feet through the soles of your boots, there is yet no appearance of a vocano in this extraordinary spot. There is no appearance of lava. The rocks around you are rapidly dissolving under the powerful metamorphic action going on.

"Porphyry and jasper are transformed into a sort of potters' clay. Pseudo-trappean and magnesian rocks are consumed much like wood in a slow fire, and go to form sulphate of magnesia and other products. Granite is rendered so soft that you may crush it between your fingers, and cut it as easily as bread unbaked. In the meantime, the boulders and angular fragments brought down the ravines and river by the floods, are being cemented into a firm conglomerate, so that it is difficult to dislodge a small pebble, the pebble itself breaking before the cementation yields.

"The thermal action on wood, in this place, is also interesting. In one mound I discovered the stump of a large tree silicified. In another, a log changed to lignite, or brown coal. Other fragments appeared midway between petrifaction and carbonization. A green tree, cut down and obliquely inserted in one of the conical mounds, was so changed in thirty-six hours that its species would not have been recognized except from the portion projecting outside, around which beautiful crystals of sulphurets had formed. From the thermal exhalations and amount of sulphur deposited, it might be supposed that the progress of vegetation would be retarded. But such is not the fact. The *Quercus sempervirens* or evergreen oak flourishes in beauty within fifty feet of the boiling and angry Geysers. Maples and alders, from one to two feet in diameter, grow within twenty feet of the hottest steam pipes. This, however, may be accounted for by the cold surface water flowing down from the mountain. Here, too, the birds build their nests and sing among the branches. Further down the stream, on the terraced banks of the liquid Pluton, vegetation actually runs wild, and the winter months exhibit all the fancied freshness of primeval Eden."

[To be continued.]

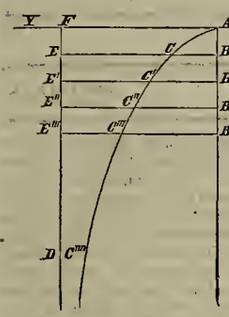
The Geological Survey of Nevada.—We have already adverted to the fact that the Nevada Legislature, at its recent session, appropriated the liberal [?] sum of $8,000 for a geological survey of that State—the largest in extent of territory in the Union. We learn from the Territorial *Enterprise* that no one has yet been found who is willing to undertake the task for the sum named; so that amount still remains in the State Treasury. Scientific men don't seem to appreciate the liberality of our sister State.

Be Careful.—A man in Bradford, Conn., recently attempted to extinguish a kerosene light by blowing down the chimney, when the lamp exploded with a loud report, setting the oil on fire and sending the fragments of glass in all directions. Never blow down into a chimney when you wish to extinguish a kerosene lamp.

A New York paper says the Colorado, in which Prof. Agassiz goes to Brazil, has 1,500 berths, and can, at a pinch, carry 3,000 passengers, and 2,500 tons of freight. She is intended for the Pacific line between Panama and San Francisco.

From the Quartz Operator's Hand Book, by Wheeler & Randal—in press.]

DISCUSSION OF THE TRACTORY AND DIFFERENTLY FORMED GRINDING PLATES.



[Continued from page 322.]

TO CONSTRUCT THE TRACTORY BY THE PRECEDING TABLE.

Draw the rectangular co-ordinate axes AX, AY, Figure 2.

On AY, lay off AF, equal to the given tangent, and draw the directrix FD, parallel with the axis AX, through the point F.

Fig. 2.

Multiply any tabular quantity in column x by the given tangent, and lay off the product as AB or AX. Draw BE parallel with AF. Multiply the quantity in column y, horizontal with the quantity taken in column x, by the given tangent, and lay off the product as BC on the line BE. The point C is in the curve.

In a similar manner determine the points C′, C″, C‴, C⁗, etc., etc., in the curve.

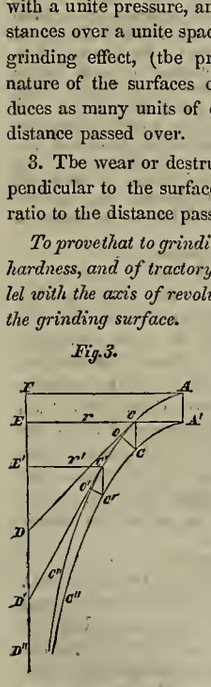
Multiply the quantity in column z horizontal with the quantities thus taken in column x and y, and the product will be the length of the curve A C, A C C′, etc., etc.

When the points A, C, C′, C″, C‴, etc., are not far apart, the arc of a circle drawn through any three of them taken consecutively, approximates the true curve sufficiently near for most practical purposes.

Ex.—Let it be required to find the values of x', y', and z', when the tangent $a = 24$ for the point C′.

Now since C′ may be any point of the curve, let the co-ordinate x be taken in the table opposite No. 17.

Then, $24\,x = \text{A B}' = 24 \times ,298611 = 7.166664 = x'$
$24\,y = \text{B}'\,\text{C}' = 24 \times ,400000 = 9.600000 = y'$
$24\,z = \text{ACC}' = 24 \times ,570827 = 12.259848 = z'$



Laws of Grinding.—1. The measure of a unit of grinding effect is the result of a body impressing a unit surface of another body with a unite pressure, and moving over a unite space.

2. A body impressing a unite surface of another body with a unite pressure, and moving under these circumstances over a unite space, producing thereby a unity of grinding effect, (the pressure being uniform and the nature of the surfaces of contact being the same) produces as many units of effect as there are units in the distance passed over.

3. The wear or destruction to the moving body perpendicular to the surfaces of contact, bears a constant ratio to the distance passed over.

To prove that to grinding plates coinciding, of uniform hardness, and of tractory conoidal form, the wear parallel with the axis of revolution is the same at all points of the grinding surface.

Fig. 3.

Let A F D″ C′ represent one half of a meridian plane of a tractory conoid taken through the axis or directrix F D″.

Draw C D = a, and C′ D′ = a each tangent to the curve at any points C, C′; also draw the radii C E = r and C′ E′ = r' parallel with A F.

Let $w = o\,c$ denote the wear perpendicular to C D, and $w' = o'\,c'$ the wear perpendicular to C′ D′.

Let P = C c and P′ = C′ c' denote the wear respectively at the points C, C′ and each parallel with the axis F D″.

1_3. Then by law 2d, $\quad w' = \dfrac{w\,r'}{r}$

2_3. By similar triangles, $\quad \text{P} = \dfrac{a\,w}{r}$

3_3. By similar triangles, $\quad \text{P}' = \dfrac{a\,w'}{r'}$

4_3. Substituting value of w' Eq. 1_3 in Eq. 3_3 $\quad \text{P} = \dfrac{a\,w\,r'}{r\,r'}$

5_3. Reducing 2d member of Eq. 4_3 $\quad \text{P}' = \dfrac{a\,w}{r}$

6_3. Substituting value of $\dfrac{a\,w}{r}$ in Eq. 2_3 $\quad \text{P}' = \text{P}$

7_3. That is, $\quad \text{C}'\,c' = \text{C}\,c$

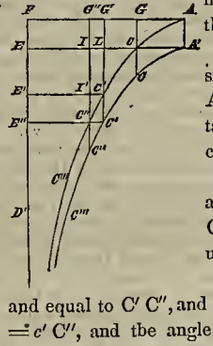
(a) Hence, as the wear is the same at any two points as shown by Eqs. 6_3 and 7_3, it is the same at all points parallel with the axis, of revolution.

(b) And hence the curve A′ c c' c'' is similar and equal to the tractory A C C′ C″.

Again, plates whose grinding surfaces are of tractory conoidal form, alone possess the property of uniform wear parallel with the axis of revolution.

To prove this proposition
Put (Fig. 3) $\quad a' = \text{C}'\,\text{D}'$

8_3. Then Eq. 5_3 becomes $\quad \text{P}' = \dfrac{a'\,w}{r}$



9_3. From Eq. 2_3 and 8_3 we have $\quad \text{P} : \text{P}' :: \dfrac{a\,w}{r} : \dfrac{a'\,w}{r}$

10_3. Reducing 2d couplet $\quad \text{P} : \text{P}' :: a : a'$

Proportion 10_3 shows that the wear P is equal to P′ only when tangent a is equal to a'; but when a is equal to a' the line or curve is a tractory. Q. E. D.

TO DETERMINE THE SOLIDITY OF A HOLLOW TRACTORY CONOID.

Fig. 4.

Let AFD′C‴ represent one-half of a meridian plane taken through the axis F D′.

Draw the curve A′ c c' c'' c''' similar and equal to the tractory A C C′ C″ C‴, and at the distance A A′, C″ c'' from it. (See conclusion (b).

Draw A′ E, C′ E′, c' E″, parallel with A F, also G c through C, G′ c', through C′, G″ c'', through C″ parallel with F D′.

Since the curve $c'\,c''$ is similar and equal to C′ C″, and the line C′ c' = C″ c'', and C′ I′ = c' C″, and the angle c' C″ c'' = the angle C′ I′ C″; it follows that the triangle c'' c' C″ = C″ C′ I′, and also similar to it.

And since the conoidal triangle C″ c' C′ is common to the parallelogram C″ c' C′ I′, and to the conoidal section c'' c' C′ C″, it follows that the conoidal section c'' c' C′ C″ is equal to the parallelogram C″ c' C′ I′.

Again, since c' C′ = A′ A = L G′, and C″ c = I L, it follows that the parallelogram c' I′ = the parallelogram L G″. Hence the conoidal section c'' c' C′ C″ = the parallelogram L G″; and since its position, in all respects, is at the same distance from the axis F D′, it is evident, if it be revolved about F D′ as an axis, it will generate a conoidal ring of the same magnitude as a ring generated by revolving L G″ about the same axis.

In the same manner may it be shown that any conoidal ring, under similar circumstances, is equal to the ring generated by revolving the corresponding parallelogram taken in A′ A F E around the axis F D′.

Hence the solidity of a hollow tractory conoidal is equal to the solidity of a cylinder having the same base and same height as A′ A, c'' C″, measured parallel with the axis of revolution.

Tractory Plates.—To determine the *grinding effect* of hollow tractory conoidal plates of uniform hardness.

Let, as in Figs. 1 and 2, the tangent or greater radius = a.

Let x and y be co-ordinates of any point, C, etc.

Let z denote the length of curve A C, etc.

Let P denote the wear parallel with the axis of revolution, by one revolution under a unit pressure to a unit surface.

Let S denote the grinding surface.

Let π denote the ratio of the diameter to the circumference of a circle.

1_4. Then, $\quad ds = 2\pi(a - y)\,dz$

2_4. Substituting value of dz of Eq. 2, in Eq. 1_4, $ds = 2\pi a\,dy$

3_4. Then, by one revolution, $2\pi\text{P}(a - y)\,ds = 4\pi^2\text{P}a^2\,dy - 4\pi^2\text{P}a\,y\,dy$

4_4. Integrating Eq. 3_4, $\int 2\pi\text{P}(a - y)\,ds = 4\pi^2\text{P}a\,y - 2\pi^2\text{P}a\,y^2$

5_4. Resolving 2d member of Eq. 4_4 into factors;

$$\int 2\pi\text{P}(a - y)\,ds = 2\pi^2\text{P}a(2a\,y - y^2)$$

6_4. By making $y = a$ in Eq. 5_4;

$$\text{Grinding effect} = 2\pi^2\text{P}a^3$$

Plane Plates.—To determine the grinding effect of plane circular plates, increasing in hardness from the center to the circumference in the ratio of the increase of the radius.

Let a = the radius of the plates.

Let y = any radius of the plates less than a.

Let P = the wear at the circumference, perpendicular to the grinding surface, under a unit pressure to the unit surface, by one revolution.

Let π = ratio of diameter to the circumference of a circle.

1_5. Then $\quad ds = 2\pi y\,dy$

2_5. By one revolution, $2\pi\text{P}y\,ds = 4\pi^2\text{P}y^2\,dy$

3_5. Integrating Eq. 2_5, $\quad \int 2\pi\text{P}y\,ds = \dfrac{4}{3}\pi^2\text{P}y^3$

4_5. By making $y = a$ in Eq. 3_5;

$$\text{Grinding effect} = \frac{4}{3}\pi^2\text{P}a^3$$

Plane Plates.—To determine the grinding effect of plane circular plates of uniform hardness.

Let a = the radius of the plates.

Let y = any radius less than a.

Let P = the tendency to wear at the circumference, perpendicular to the grinding surfaces.

Let S = the surface of which y is the radius.

Let π = ratio, etc.

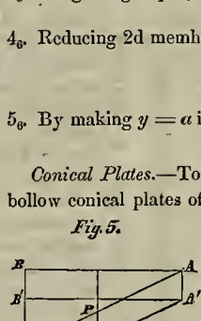
1_6. Then $\quad ds = 2\,\pi\,y\,dy$

Now, it is evident that when the tendency to wear at the circumference and at the distance a is P, that the tendency to wear at the distance y from the centre will be $\dfrac{\text{P}y}{a}$

2_6. Then by one revolution $\dfrac{2\pi^2\text{P}}{a}y\,ds = \dfrac{4\pi^2\text{P}y^2\,dy}{a}$

3_6. Integrating Eq. 2_6 $\quad \int \dfrac{2\pi^2\text{P}}{a}y\,ds = \dfrac{4\pi^2\text{P}y^4}{4a}$

4_6. Reducing 2d member of Eq. 3_6 —;



$$\int \frac{2\pi^2\text{P}}{a}y\,ds = \frac{\pi^2\text{P}y^4}{a}$$

5_6. By making $y = a$ in Eq. 4_6,

$$\text{Grinding effect} = \pi^2\text{P}a^3$$

Conical Plates.—To determine the grinding effect of hollow conical plates of uniform hardness.

Fig. 5.

Let, in Fig. 5, the right angled triangles A B C and A′ B′ C′, similar and equal, and at the distance A A′ = C C′ apart, be revolved about the axis B C′.

Then will the solid generated by A A′ B B′ be equal to the solid generated by C′ A′ A C.

Let a = the radius B A.

Let h = height of cone B C = B′ C′.

Let P = tendency to wear at A, parallel with the axis of revolution, by one revolution of the plate under a unit pressure to a unit surface.

Let x and y be co-ordinates of any point P.

Let z = C P the slant height of that cone the radius of whose base is y.

Let S = the surface whose slant height is z.

Let π = ratio, etc.

1_7. Then by similar triangles $\quad x = \dfrac{h\,y}{a}$

2_7. And (Euclid, Book 1, Prop. 47) $\quad x^2 + y^2 = z^2$

3_7. Squaring Eq. 1_7 $\quad x^2 = \dfrac{h^2\,y^2}{a}$

[To be Continued.]

[Written for the Mining and Scientific Press.]

Museum of Comparative Zoology at Cambridge, Mass.

[LETTER FROM PROF. BREWER.]

Messrs. Eds:—I wrote you, a few weeks ago, some account of the *Gray Herbarium* and *Botanical Garden* connected with Harvard University; and now a few words about the *Museum of Comparative Zoology*, of which Prof. Agassiz is director. He is the father of this, and private and State aid have combined to make it a great enterprise. Only one wing of the museum is yet built; a large brick edifice, five stories high, built in the most substantial manner, and is fire-proof. The larger part of this building is devoted to working rooms, where specimens are prepared, studied or stored, but there are four large rooms, each occupying two stories of the height with galleries, and finely arranged for the display of specimens to the public. This part is open to the public every day and is very extensive, even now, rivalling the fine collections of the Old World, although it is considered but the beginning of what the finished institution is to be. The great lack now is the means to display what is already on hand. From basement to roof are stored the treasures from all parts of the world—boxes, bales and barrels waiting to be opened, their contents arranged, and placed available for study. It will take much time and much money to do all this, but slowly and steadily the work goes on by the zealous labor of the assistants.

The arrangements for study and exhibition are very good—glass cases around the walls, and in the centers of the rooms, and occupying every available space in the well lighted, well warmed and ventilated rooms—the skeletons of animals, their stuffed skins, birds, fishes and other objects in alcohol, where all may see them, and convenient rooms where they may be removed to and studied. This last, is of course the great feature, although to the public, the display of specimens seems the principal feature. Not the least interesting part of the collection, is the geological portion. Fossils especially, from all parts of the world, where they can be obtained. Of course Europe is better represented than the United States, because their attention has longer been turned to that, and more people are interested.

The institution is established for the advance of pure science; but of course the public value it according to its uses to those studying practical science; and of this it is not wonderful. Every facility is offered to any and *all* who wish to study, whether the ends pursued are the advance of scientific knowledge or the dissemination of its more practical truths. As an illustration, a friend in a distant city, desired me to ascertain if facilities would be offered him here for a comparison of fossils from the far west, in his possession, with those of the supposed similar formations of Europe and the United States. In making the inquiry, I was answered by the zealous director "certainly, our collection is very complete in all that relates to that formation, especially in European fossils; tell your friend to come, the sooner he comes, the longer he stays, and the more he uses our material the better I will like it."

Here is perhaps the true secret of the wonderful popularity of this new institution; the desire that it shall be not only very complete, but very useful. While we cannot hope for anything quite so extensive in San Francisco now; yet we should make a begining in the geological department and in natural history, so far as the productions of the Pacific States are concerned. It may interest your readers to know what Prof. Agassiz thinks of the collections of the State Geological Survey. He assured me most earnestly, but last Saturday, "so soon as you can take care of them, and have a start, *I will give you unnumbered specimens* for your California Museum. We have immense numbers of duplicates, and thousands of specimens will be placed at your disposal as soon as you can and will take care of them. Especially in the illustrations of European Geology can I give you very complete sets," and more to the same purport.

He sails for Brazil this week with six assistants, a wealthy Boston gentleman, Mr. Thayer, pays the bills, and a steamship company gives them a free passage. They will visit the Andes, and be gone eight or nine months, and will doubtless do much to advance our knowledge of the countries they visit. This same Mr. Thayer has aided the University in other ways, and is the same gentleman I mentioned in my last letter as having built a building for the Gray Herbarium last year.

Yours truly, WM. H. BREWER.

Cambridge, Mass., March 21st., 1865.

Mining Summary.

WASHOE.

A large amount of prospecting, according to the *Union*, appears to be going on at present in Washoe. Several new districts have been found, and ledges are being developed in several districts which claimed attention last summer. The extraordinary richness of some of the newly discovered ledges, in outside districts, is exciting marked attention. The greatest difficulty which the prospectors and the pioneer mining companies have to contend with, is the scarcity of water, which exists in almost all the new districts. In almost all sections, however, where reduction works are desired, a sufficient supply of water can be obtained by sinking artesian wells. The plan of proceeding has been adopted with success in the Desert district, which is as sterile and arid a section as any which prospectors have yet attempted to open.

The Saphire mill is being overhauled and repaired. Eight amalgamating pans will be added, in addition to the forty already in the mill.

During the past ten months the Savage Mining Company has paid to the various mills engaged in crushing rock from the mine the sum of $940,000—an average of $94,000 per month! This outlay, does not include the vast sums expended for labor, machinery, etc. There are about 200 men in the employ of the company.

Messrs. Proctor & Stanley are erecting a water mill near the mouth of Six Mile Canon, below De Laud's Mill, for the purpose of catching and working the tailings from the mills above. The Gould & Curry tailings are rich enough to haul over to Franktown in Washoe Valley, where they are crushed by the Frieburg or barrel process. The working of tailings in Gold Cañon has long been followed with good profit.

The *News* says the Crown Point Company has commenced sinking in its shaft deeper. The shaft is now two hundred and fifty feet in depth.

Mining at American Flat, just now, begins to be renewed, and indications of much prospecting are apparent.

Work upon the various ledges in the Truckee district is being vigorously prosecuted. The great drawback to that district is the luck of water. A survey is about to be made for a ditch to bring in the waters of the Truckee river. About 100 ledges have been located in the district.

ALPINE COUNTY.—The *Monitor Gazette* claims that the Comstock lode passes through Mogul, Monitor, Alpine and Silver Mountain districts of that county. It says the general course of their main or "mother" ledge is just east of north, and runs directly towards Mount Davidson, which is plainly seen in the distance.

The prospects of Silver Mountain district, in that county, have been greatly retarded, according to the Silver Mountain *Bulletin*, in consequence of the undue speculating furor with which those stocks were first introduced into the market in San Francisco. They were freely sold here, at one time at from $5 to $50 per foot, the purchasers fancying that their claims were being energetically developed. The effect of such illegitimate practices on the part of a few operatives still rests heavily on Alpine county. The *Bulletin* urges an early and energetic development of the mines, and predicts a most satisfactory result from such a course. Work has already commenced on the Ruby, and a working lot of rock will soon be ready for crushing. Rock from this lode has yielded at the rate of $600 per ton. Work has also been commenced on the Live Yankee, and rock taken out which shows silver freely by roasting in a blacksmiths' forge.

The Alpine *Chronicle* of the 13th inst., says that the mills of that section will soon commence turning out bullion. It claims that the experiments with the Rivot process, at the furnace of the Pioneer mill is a complete success with rock from the I X L. As soon as the necessary roads can be completed the Pioneer mill will be supplied with rock and put in operation. The Whitesides mill is also being put in order.

REESE RIVER.

The *Reveille* says that the richest leads yet discovered in Lander county are located in North River. A quantity of ore was worked and produced $8,000, at an average of $500 per ton for the entire vein. Much of the ore is a pure horn silver, cutting like lead, and would assay $2,000 per ton. The value of the ore in sight is immense, and is estimated at from $20,000 to $30,000.

The Murphy ledge, on Twin river, has been purchased by Col. Massey, who will at once proceed to the erection of a mill.

The Eagle mill has been sold to Boston capitalists who are about to replace it by a twenty-stamp mill, under the superintendence of Dr. Jackson.

A new mill, involving a novel principle, will soon be erected by the Roman Bros. of New York city, on a ledge near the Midas mill.

Two hundred and twenty-four dollars were recently taken out of 100 pounds of rock from the Revenue lode. There have been forty-two tons of all classes from this mine worked, which has produced about $11,000, being but about sixty per cent. of the assay.

Messrs. Nevins & Hussy have commenced the construction of a new fifteen-stamp mill at Yankee Blade.

HUMBOLDT.

Fall's mill was running at last accounts. Mr. Torrey, who for a year past has been amalgamator, and with usual success, has now taken the establishment on lease. The Alpha is running constantly, Mr. Holt shipped 422 ounces of bullion on the 12th instant.

At the Ætna, E. G. Taylor, the superintendent, is putting in good work, and is taking out considerable ore. He has from forty to fifty tons on the dump.

The Bullion ledge has been sold to an Eastern company, represented at the mine by Gov. Bigler. The Governor will proceed, without delay, to erect a mill. He had a thousand pounds worked at Holt's mill in Echo. It had not been assayed when he took the bullion with him; but was estimated by experts to be worth $35—making a working value of $70 to the ton.

The "Daisy" is one of the later locations in the Arabia mines, Trinity district, composed of the same class of mineral as the other ledges in Arabia, assaying a little over $15 to the ton on the top, and improving rapidly as the depth is gained. Ore from the Montezuma has assayed $150 to the ton.

ESMERALDA.

A very rich series of ledges has recently been discovered by a soldier from Fort Independence, in the Owen's River country, and about twelve miles from the Fort. It is said to be wonderfully rich, with eight or ten parallel ledges. Mr. Sheldon has arrived in Virginia City with a large lot of specimens, some of which show large quantities of gold. Wood is very scarce at the mine. The district has been named Kearsarge.

A ton of silver ore from the Scorpion claim, Montgomery district, recently yielded $684 in an arastra. A ton taken from the Sprague claim yielded $124. The Ranger claims is yielding large quantities of excellent ore.

Mr. T. Cronin is about to put up a new quartz mill at Bodie's Bluff, Esmeralda. The mill will be 80 by 120 feet in size and will contain fifty stamps, machinery in proportion. The mill is being erected by a New York company to work a mine they have purchased in that vicinity. Mr. Cronin expects to be absent some two months. He has the coatract for the stone work of the mill, and for the setting of the boilers, etc.

CALIFORNIA.

NEVADA COUNTY.—The Irish and American Company, at Birchville, made a "clean up" after ten days' run, taking out as much dust as two men could put into a wagon. Its value was about $20,000.

The *Transcript* of the 31st ult., speaks of a splendid prospect, taken from the Andy Johnson quartz ledge, located on an extension of the Willow Valley lead. The company sunk down upon the ledge and struck it where it was large and gave evidence of great richness. The water prevented them from working further in the shaft and they have now a force at work, day and night, running a tunnel into the hill for the purpose of striking the ledge.

TEHAMA.—A rich ledge has been struck at Grizzly Hill, samples from which paid $20 per pound and $60 per flour-sackful.

The *Pioneer* says that Kelley's mill is running night and day, and from the amount of amalgam taken out it is thought that the present run on Killenger rock will pay handsomely. Workmen are busily employed taking rock from the Baxter lead, and Kelley will commence reducing the same soon.

PLACER.—White & Crawford are prospecting a ledge a short distance north of Auburn, in the same range with the Green Emigrant. A small lot of rock worked by Hinkley's pan yielded $70 in gold and silver.

CALAVERAS.—The mill at the Reservoir is running night and day on good rock. A new mill is in process of construction at Salt Spring Valley.

About 500 tons of copper ore are now shipped weekly from Stockton from the various mines about Copperopolis. The prospect is that the Table Mountain mine will yield quite a large amount of ore during the summer. We condense the following from the Calaveras *Chronicle:*

The Union mine is yielding immense quantities of first and second class copper ore, and the proprietors are now shipping, daily, about seventy-five tons of the former.

The Keystone is rapidly improving, especally in the drift approaching the Union mine, where a good vein of No. 1 ore has recently been exposed.

Work upon the Empire mine is steadily progressing; the amount of ore being extracted at present is not large, but the quality is excellent. Two large piles of picked ore remain near the engine house, awaiting the pleasure of the company.

The U. S. Grant are now taking out splendid ore at a depth of sixteen feet. The new quartz mill in Salt Spring Valley, is rapidly approaching completion. The work was delayed for some time in consequence of the non-arrival of the lumber, and other necessary material.

A party of San Francisco capitalists are about to build a quartz mill near John Dowling's ranch, about a mile from San Andreas. It is said that the Rathgibs have sold their quartz lead and mill at Lower Calaveritas for the snug sum of sixty thousand dollars to San Francisco capitalists.

The San Andreas *Register* says that several companies are about to be organized at Murphy's to prospect some quartz claims in that section, which are believed to be rich, and from which fine prospects have been obtained.

The *Register* says that while some miners were at work running a tunnel into Gold Hill, near San Andreas, they ran across a well defined lead of something resembling silver. They have not had it fully tested yet, to ascertain what the mineral is.

How to Test the Purity of Coal Gas.

Properly prepared coal gas should be free from sulphuretted hydrogen and carbonic acid gas, as both are injurious to health. Now to test gas for the presence of the former, obtain a strip of litmus paper slightly tinged red by an acid, such as may be procured at any drug store in the city. If the gas is pure, the color of the paper will not be changed after several minutes exposure in the current of it, if it turns blue, the gas is impure. Or a slip of paper, dipped in a solution of acetate of lead, held in a current of gas will remain white, if it contains no sulphuretted hydrogen, but will turn from brown to black in proportion to the quantity of this deleterious impurity it contains. If gas, passing through a clear solution of lime water, causes it to appear milky, it contains carbonic acid, and is dangerous to use for domestic purposes.

HOW TO TEST COAL OIL.—To test whether any substance, sold as coal oil, is free from danger in its use, place a small quantity of the oil in an open dish above a vessel containing water; heat this water to a temperature of 130° Farhenheit. If the oil does not then ignite by the application of a lighted match, there is no danger in using such oil; but if it should ignite below 130°, it is dangerous to use for domestic purposes.

As certain interested parties are endeavoring to decry all the coal oil introduced into the State, except that of one firm, for the evident purpose of giving that firm a monopoly of the business, we make this very simple, but most effective test known for general information.

TO TEST ASPHALTUM.—Pure asphaltum dissolves entirely in oil of turpentine; lime, with which it is generally combined, dissolves in dilute muriatic acid in about twelve hours. Persons who are searching for coal oil will do well to observe these tests.—*Flag.*

STEAMERS ON THE COLORADO.—Considerable interest is being manifested just now concerning the navigation of the Colorado River. It has been demonstrated that the stream is navigable for several hundred miles, and the fact established that freight can be transported cheaper and quicker over that route than any other. Of the steamers on that river an exchange says: "The Colorado Steam Navigation Company has the *Colorado*, Captain Johnson; *Mohave*, Captain Polhemus; *Cocopah*, Captain Robinson. The Philadelphia Mining Company has the *Nina Tilden*, Captain Avery; Captain Trueworthy has the *Esmeralda.*"

THE Sanitary Commission still wants aid, to assist in getting wounded soldiers home from the hospitals, secure bounties, pensions and back pay, procure employment for the partially disabled, provide asylums for those without friends and unable to take care of themselves, etc. Let the good work proceed

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

San Francisco, Saturday Morning, June 10, 1865.

Money continues very abundant and there is no difficulty in negotiating anything ordinarily acceptible in bank, provided, it be free from the taint of mining speculations. The demand upon mining or stock collaterals is exceedingly active, but these are in no more favor with bankers than they have been for a month past, in fact, there seems to be less disposition to accept them as security, and yet no doubt is entertained of the value of the leading shares on the market. Rates of interest still rule at 1¼@1½ ₱ cent. per month in bank and at 2@3 ₱ cent. for outside negotiations.

Receipts of treasure from the interior since the 1st inst. amounted to $1,500,000, and the supply of bullion is more than adequate to the shipping demand. Gold bars have been taken to account by bankers at 820@830 and silver bars are plentiful at Par to 2 ₱ cent. discount.

Legal Tender Notes have been rather inactive during the week and were less firmly held. The subscriptions to the seven-thirty loan are not absorbing them to the extent anticipated, and with a large supply in the hands of nearly all dealers, the market is weak. Latest telegraphic advices from the East also indicate higher quotations for gold. $94,000 were dealt in at the Board, receding from 77½c to 76¼c, rallying to 76⅝c, and closing at about 76½c bid.

The mining share market has exhibited rather more vitality this week, but the improvement noted on Saturday last has only been partially sustained. The affairs of certain companies have furnished a theme for considerable discussion lately, and although the truth of some of the remarks made in the local press of this city, can hardly be denied, yet we cannot but regard them as too sweeping and general in their character. We are quite willing to take a conservative view of this business, nay, to look on the dark side even, and discourage everything that seems like infatuation and folly, or dishonesty; to expose bogus mines and swindling representations: but we cannot, nor will the public be insensible to the industry, zeal and enterprise of some of the officers whose integrity and capacity are now so wantonly assailed

Yellow Jacket rose from $1,400 to $1,500, fell to $1,350, and sold yesterday at $1,330@$1,310. Within this range 88 feet were dealt in. An average of about 185 tons of ore have been taken daily from the mine this week, yielding, it is said, some $40 per ton. No material change has taken place in the appearance of the lower level. Portions of it continue to look well and promise to furnish a good supply of ore for some time to come. The company are prosecuting work upon their new shaft with great vigor and have recently added more power to their hoisting machinery.

Gould & Curry is in much more favor and small sales were made, advancing from $1,525 (ex-dividend of $50 per foot, paid on Monday last) to $1,675, receding to $1,650, and closing at $1,640 bid. The product of the mine for the month of May, exceeded 3,000 tons, and the receipts of bullion in this city, during the same period, exceeded $210,000. In addition to the yield of ore from this mine some 200 tons of tailings were worked over by the Company's mill.

Savage steadily rose from $1,300 to $1,370, declined to $1,230, rallied to $1,260 and closed at about $1,175. In all, 87 feet were sold. About 100 tons of ore per day are now taken from the mine, which is said to yield less than $33 per ton. From the 5th of May to June 5th, the Company's receipts of bullion, in this city, were $140,000.

Alpha has materially improved and was very actively dealt in, some 202 feet changing hands, advancing from $700 to $940 per foot, receding to $820, rallying to $1,000, and closing at $930. Recent advices from the mine are deemed quite favorable. At a depth of fifty feet below the 500 feet level, a prospecting shaft and drift have disclosed a large body of good ore some fifteen feet wide.

Ophir rose from $460 to $490, receded to $485, and was sold at the close at $460. At these rates 64 feet changed hands.

Hale & Norcross is in better favor and 83 feet were sold, advancing from $430 to $500, receding to $490, and selling yesterday at $480. The drift is now in about fifty feet from the bottom of the 700 feet incline.

Empire Mill & Mining Company is inactive but well held at about $460 per share. In drifting east at a depth of 545 feet, a ledge of good ore some seven feet in width has been met with this week.

Belcher is in less request and has been freely offered at declining rates; 105 feet were dealt in, advancing from $950 to $1,000, receding to $680, ex-dividend of $51 per foot, rallying to $725, dropping to $650, advancing to $730, declining to $710, and selling yesterday at $685@$700. Recent crushings, it is stated, did not result as favorably as was anticipated, and no new developments are reported.

Crown Point is also less firmly held and 52 feet changed hands, receding from $950 to $750, advancing to $800, and closing yesterday at $800. From the annual report of the officers of this company, made on the 6th inst., we glean the following: During the past year, ending May 1st, the Crown Point mill has crushed 1,977 tons of ore, yielding $73,395, or an average of $37.12¼ per ton. Besides crushing ore, the engine of this mill has raised, of ore and waste rock 7,530 tons, to do which, other mines usually pay $1 per ton. Eight months were required to pump the water out of the mine, at a cost of $16,000, which would leave the cost of reducing ore at the Company's mill $12 or $13 per ton. Outside mills have been employed to crush 1,789 tons of ore at a cost of $20 per ton, yielding $60,685 or $33.92 per ton. The total receipts of the company from June 1st, 1864 to May 1st, 1865, amounted to $197,583.53, and their liabilities were $1,655.33 on the 1st of June.

Potosi has been steadily maintained, advancing from $205 to $270, (assessment of $50 delinquent) and selling yesterday at $260@$270. Chollar rose from $225 to $280 (assessment of $50 delinquent), and closes at $290 bid.

Uncle Sam has been dealt in from $125 to $195 per share. Minerva fell from $155 to $120, and then rose to $130. Central was sold at $200 per foot.

Imperial has continued to attract attention and is a prominent feature of the market, opening at $138 per share, advancing to $175, receding to $150, rallying to $172½, declining to $160, seller 30, and selling yesterday at from $171 to $174. In all 2,228 shares were sold. No particular change has taken place in the lower level, which still looks quite promising. We have no accurate figures as to the results of late crushings, but are promised for next week a full statement of the Company's receipts and disbursements since the 1st of May.

Bullion rose from $130 to $150, declined to $120, rose to $130, and closed at $130. Burning Moscow rose from $44 to $54, and closed at $48½. Cal. Steam Navigation was sold at $750 per share; Spring Valley Water at $50, and Pacific Insurance Company at $138 per share.

The recorded sales of stock, since Saturday last, amounted, in the aggregate, to $1,050,442.

RETENTIVE POWER OF SOILS.—A contributor to the *Plowman* condenses the results of prolonged experiments in the following :

Soiles are divided or classified according to the preponderance of their constituents of sand, clay, lime and animal or vegetable remains or humus.

Sandy soils contain over 80 per cent. of silicious sand. Calcareous soils contain over 20 per cent. of lime. Clay soils contain over 50 per cent. of clay. Vegetable molds contain over 6 per cent. of organic matter or humus. Marly soils contain more than 5 per cent. of the weight of dry earth, and from 20 to 50 per cent. of clay.

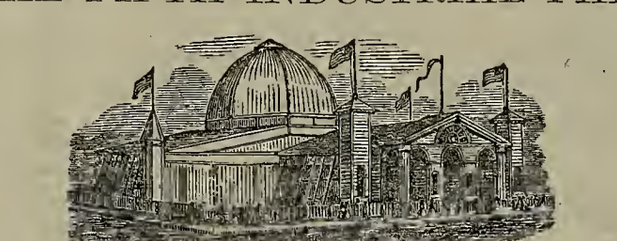
Loamy soils are those in which the proportion of clay varies from 20 to 50 per cent., and which at the same time hold less than 5 per cent. of lime, and so on.

Now, it is found that the power of retaining or holding moisture depends on the composition of the soil. Thus, an experiment designed to show the retentive power of these different soils resulted in the following manner: In 100 lbs. of dry soil water will begin to drip, if it is a quartz sand, when it has absorbed 25 lbs. of water; calcareous sand, 29 lbs.; loamy soil, 40 lbs.; English chalk, 45 lb ; clay loam, 50 lbs.; pure clay, 75 lbs.

Those soils which absorb the greatest amount of water, hold it with the greatest tenacity. Dark colored soils absorb and hold a greater amount of the heat of the sun's rays, than light colored ones, but the light colored retain the rays longest. Many circumstances beside the chemical composition of a soil, exercise an extensive influence upon its productive or fertilizing power.

The absorptive power of soils is so great, that they separate ammonia from its various solutions. If liquid ammonia is passed through a quantity of soil, it loses its ammonia, and the order which indicated its presence. But there is a limit to this power. If the quantity of soil is too small, the ammonia will not all be taken out.

Soils have the power of absorbing potash in solution. A stiffish subsoil, when simply thrown out and exposed to the air and rains, would become to some extent impregnated with these salts, and hence their value as absorbents in the yard, or mixed in the manure heap. But all cultivated soils have the power of separating the potash, ammonia and other alkaline substances from their various combinations, differing only in degrees.



THE WORKING WORLD.—Work, of the muscles or the brain, is one of the conditions of human happiness. Without it there can be no wholesome enjoyment. The idle man either seeks a substitute for the healthy excitement of labor in vicious indulgence, or degenerates into a being only a few degrees above the lower animals. His soul and mind, in the one case, become degraded and debased by false uses ; in the other, they rust with him, and he is left to the government of the mere instincts which he possesses in common with the brute.

The truest life—that most accordant with our nature—is one in which physical as well as mental labor are judiciously mingled, alternating with such reaction as tends to refresh and renovate both. Neither constant toil nor incessant study is advisable. When both head and hands are weary, try a little amusement—light reading of a wholesome kind, a romp with your children if you have any, a social evening with a neighbor—anything in fact, that may properly be warranted to wear well, and it will not be clouded with fits of the blues. He who lives it will be younger in feeling at fifty than the fast man, whose career has been a gallop after excitement, at thirty five.

If you belong to the working world, and eat your bread in the sweat of your brow, do not fancy that you have, therefore, no opportunity to enrich your mind. Labor, thank heaven, is not so ill paid in this country that the toiler cannot afford to throw down his tools now and then and cultivate his intellect. Two-thirds at least of our distinguished men have been farm laborers and handicraftsmen. Very few of them were "college bred." Our common schools impart all the instruction necessary to enable their pupils, in after life, to educate themselves thoroughly in the highest branches of knowledge, which the human mind is capable of mastering. Moreover, let it never be forgotten that our greatest statesmen, discoverers, inventors, scholars, and artists, have sprung from the ranks of Labor, and not from the Silk Stocking classes.

BULLION VS. MINERVA.—The Bullion Company brought suit of ejectment to recover 300 feet of Minerva ground, 300 of Superior, 500 of Croesus, and part of the Alpha. The suit, so far as the Alpha was concerned, was settled many months ago, and the verdict rendered in favor of the Bullion last week does not affect the Alpha. The Minerva Consolidated Company held the Superior ground, the original Minerva ground, and the Omega ground. This last claim is 290 feet long, and is not affected by the verdict; the other two claims are covered by it.

THE FIFTH INDUSTRIAL FAIR

OF THE MECHANICS' INSTITUTE OF SAN FRANCISCO,

To be Held in the Mechanics' Institute Pavilion in August, 1865.

The Mechanics' Institute having determined to hold their Fifth Industrial Fair during the coming season, the Executive Committee would respectfully invite all persons desirous of exhibiting Machines, Manufactures, Agricultural Implements, Horticultural Products, Minerals, Ores, and Works of Art, to make application immediately, in order that the proper space may be allotted them.

The Exhibition will be open to the public on Thursday, the 17th day of August, at 10 o'clock A. M.

The general management of the Fair is entrusted to an Executive Committee, consisting of the officers of the Institute.

No contracts or agreements will be recognized unless made by the authorized agents of this Committee.

A competent person will be in attendance at the Pavilion to receive and register all goods designed for exhibition, and will receipt therefor.

Contributions of Machinery and other articles that require long time to prepare for exhibition, will be received from the 15th of July to the 2d of August.

Articles for exhibition that require large space may be entered on or before the 20th day of July, and space will be allotted to the exhibitor on or before the 2d of August.

The Picture Galleries will be ready for the reception of Pictures, Embroideries, Wax and Fancy Work of all kinds, on the 1st of August, when space will be allotted.

The Committee will be prepared for the reception of Fruits, Flowers, Agricultural and Horticultural Productions, and design to have the tables so arranged that the best display possible can be made in this department, and every effort will be made and care taken to preserve their freshness, so that exhibitors may receive full credit for their productions. Those wishing space on these tables should engage it at an early day. There will be space reserved for additions in this department during the Fair.

The several transportation companies, as on former occasions, have, with commendable liberality, consented to transport articles intended exclusively for exhibition free of charge, and Messrs. Wells, Fargo & Co., in like manner, will take charge of them.

The Committee have the fullest confidence that the coming Fair will not only be the most complete and varied in its character, but will also be more attractive than any previous exhibition of this kind on this coast.

No pains or expense will be spared to give the contributors satisfactory opportunities in the spacious pavilion of the Institute for the display of their contributions, and to furnish whatever may be necessary to make the Fair an institution where those who frequent it may be both pleased and instructed.

All articles forwarded should be labeled "For the Industrial Exhibition," San Francisco.

All communications to be addressed to C. S. HIGGINS, Corresponding Secretary.

EXECUTIVE COMMITTEE.

CHARLES M. PLUM, President.

P. B. DEXTER, Secretary.

MINING AND SCIENTIFIC PRESS

PATENT AGENCY.

For the Pacific Coast.

OFFICE OF THE MINING AND SCIENTIFIC PRESS—No. 505 Clay street, corner of Sansome, San Francisco.

Information for Inventors!

Inventors on this coast having their applications for patents made out through our Agency can sign their papers at once, and thus secure their rights at least three months sooner than by trusting the same to distant agencies, situated in New York or Washington.

The Patent Law Amendment Act, of March 4th, 1861, and March 3d, 1863, now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The amendment of 3d March, 1863, provides, in section 3, that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be witheld, and the invention therein described shall become public property as against the applicant therefor: *Provided*, That in all cases where patents have been allowed previous to the passage of this act, the said six months shall be reckoned from the date of such passage.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is : "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the lawyer can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain ; do not use pencil or pale ink ; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

Preliminary Examinations.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search made at the U. S. Patent Office, Washington, through the medium of our associate in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved ; if the invention has been in part patented, the applicant will be enable to modify his claims and expectations accordingly. Many other obvious advantages attending the Preliminary Examination ; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication ; or some other person has been previously rejected on an analagous device ; or some other invention for a similar purpose, but partially resembles the applicant's in its construction ; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide ; it will, however, generally inform the applicant whether an improvement similar to his and used for the same purpose has ever been patented or not in this country.

Persons desiring the Preliminary examination are requested to remit the fee ($10), and furnish us with a sketch and description of the invention.

Caveats.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared, and for the service varies from $10 to $20. The Government fee under the new law is reduced to ten dollars ; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention ; no model being necessary.

Expense of Applying for a Patent, Rejections, etc.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars ; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of governments that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is from $20 to $40. If the patent is granted no further agency expenses ensues. If the application is rejected we cause a thorough investigation to be made into the reasons presented to the Commissioner for refusing the patent. In making this examination, we have excess to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client.

If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent ; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

The system adopted by us works well, gives general satisfaction and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorney's, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in many cases of such a matter. Our terms for such cases are very moderate.

Models, Remittances, etc.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions ; it should be neatly made, of hard wood or metal, or both, varnished or painted ; the name of the inventor should be engraved or painted on it conspicuously.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely : DEWEY & Co., Mining and Scientific Press, No. 505 Clay Street, corner of Sansome, San Francisco, Cal. Prepay expenses and send express receipt to us by mail.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance stating the name and address of the sender.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the receipt of the model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government fee, namely, twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication ; the business can be well done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time ; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

Return of Models.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

Application for Patents, Designs, Trade-Marks, Labels, etc.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving or stamping upon silks, calicoes, carpets, oil-cloths, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented ; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc.

Our facilities for the prompt preparation and securing of patents are of the most thorough character and our charges are very moderate.

Patent Office Fees and How Payable.

Nearly all the fees payable to the Patent Office are positively required by law to be paid in advance. For the sake of uniformity and convenience, the remaining fees will be required to be paid in the same manner ; that is to say, before the labor is performed for which they are to be received in payment.

The following is the Government tariff of fees established by law :

On every application for a design, for 3 y'rs and 6 mos...	$10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	30
On every application for a patent, for seventeen years...	15
On every caveat.....	10
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Commissioner from Examiners-in-chief	20
On every appeal to the Judges of Circuit Court, D. C....	25

Infringements.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunction from the Court, to an arrest of or prohibition from the employment of his machinery, shop, works, factory and men in production of the article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable either collectively or individually.

Having access to all the patents, models, public records, drawings and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Appeals.

Many important cases are brought before the Judges on appeal and the decisions of the Commissioner are not infrequently reversed.

We have had successful experience in conducting these appeals and our services are rendered on moderate terms.

DEWEY & CO., Agents,

Mining and Scientific Press Office, No. 505 Clay street, cor ner of Sansome, San Francisco.

Just and True Economy

IN MINING ADVERTISING.

The Proprietors of the MINING AND SCIENTIFIC PRESS would call the especial attention of MINING SECRETARIES, TRUSTEES and SHAREHOLDERS, to a few substantial reasons for the publication of Mining Notices in their journal—the first and only important newspaper of its class published upon this coast.

1st. The PRESS enjoys a large and permanent subscription list, having a more universal circulation among shareholders and men intimately connected with mining interests than any other publication.

2d. Under the present law the publication of all mining notices on Saturday, in a weekly journal, complies as fully with the statutes as a daily publication. It is generally found to be equally as convenient for secretaries, and decidedly preferable to stockholders who have not time to examine throughout every issue of a daily.

3d. Economy in mining should always be looked upon with favor, and the cost for weekly advertising in the PRESS is less by ONE HALF than the rates of any other journal in this city possessing a respectable circulation.

4th. The publishers of the PRESS, making the mining interest their especial business, take particular pains to assist in the avoidance of errors in advertising. Our print is also more clear and perfect than can be expected in such papers as are hurriedly issued from cylinder presses.

5th. Our "Shareholders' Directory" forms a complete index of all mining notices published in San Francisco, by reference to which shareholders can at once see if their company is advertised, and determine whether the same is inserted in the PRESS or some other paper.

6th. Many copies of the PRESS are bound by prominent professional men, mechanics, secretaries, brokers, shareholders and others, as an important record for future reference, thereby rendering advertising, of every class, in its columns, of permanent and permanent value.

7th. The benefit of having all mining notices consolidated in one newspaper, for the common convenience of shareholders, secretaries, and others who have occasion to refer to the same, is obvious. With this view we have established our rates at only fair living prices, believing that a journal like ours, unhampered by party, creed, or prejudice, is the only medium which can reasonably ask for such a consolidation of mining patronage.

8th. Advertisements in the columns of the PRESS, after their first insertion, are arranged alphabetically. Our present list is equalled only in number of names by that of any other journal. Shareholders, as well as strangers, naturally turn their attention to a mining journal for information concerning the mines and mining matters.

LAST, BUT NOT LEAST.—Our sheet (having been recently enlarged to the size of Harpers' Weekly) is now only equalled in its dimensions by one mining paper in existence—the *London Mining Journal*. Published in this, the greatest mining field of the world, we desire that the PRESS shall have no superior. We can only realize our cherished object of building up a reliable advocate of the science and business of mining, which will be of just honor and profit to our community, by experience and liberal patronage. The bestowal of such favors only as naturally belong to us, and which it is clearly for the benefit of the mining fraternity to extend, is all that is requisite, and we are confident we shall receive it.

Mining and Scientific Press.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:

Saturday Morning, June 10, 1865.

Removal.

The Office of the MINING AND SCIENTIFIC PRESS has been removed to the old printing stand known as Waters Bros. & Co., southwest corner of Clay and Sansome streets, opposite the Niantic Hotel (being one block south of our former location), where we may now be found, with more commodious apartments and an extensive JOB PRINTING OFFICE.

San Francisco, April 10th, 1865.

A NEW SAFETY CAGE.

One very important object to be sought after in improvements in the economical working of mines, should be the prevention of accidents. This is a matter which has occupied a large share of the attention of English mining engineers, and of the friends of humanity generally, in that country. To this end the careful construction and care of shafts, drifts, ventilation, etc., is made a special subject of study in their mining schools, and the English mining publications are replete with instructions and warnings in this particular. The same remark is also applicable to the use of machinery in general for manufacturing purposes. Full statistics are carefully kept, under Government direction, we believe, of all mining accidents which occur. These cases are carefully analyized, their causes, so far as possible brought to the notice of the public and the most effectual remedy suggested. About one-third of the accidents which formerly occurred, took place in and about the shafts. The frequency of these cases have led to the more general use of substantial frame work around the tops of shafts, a careful covering of unused ones and the adoption in most of the deep mines of "safety cages," instead of open tubs. These cages are so constructed that cars from the track, either above or below may be readily run into them, and they afford an almost perfect immunity from danger from falling substances and from the breaking of hoisting gear.

All who have any extensive acquaintance with mining operations on this coast, must be aware of the alarming frequency of that class of accidents here. Open and abandoned shafts are found everywhere throughout our mining districts; and the first instance we have noticed of the introduction of anything really valuable in the shape of a "safety cage," has just come under our observation in the Virginia papers of the past week. We append a description of the machine, which appears to possess important advantages over everything of the kind which we have seen described as in use in Europe. All such improvements being for the furtherance of humanity we heartily commend this as worthy of general introduction into our mines. It is the invention of Messrs. Berry, Hochholzer & Denver, of Virginia City, and has already been introduced at the Savage mine. Application for letters patent for the same have been made through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. The *Enterprise* says of it:—

With the new cage it is next to impossible for an accident of any kind to occur to a miner while going up or down our deep shafts. It is about eight feet high and is constructed almost wholly of iron. Over the head of the miner is a roof of heavy boiler iron, which completely protects him at all times from anything that may fall into the shaft. Then by another very simple yet most efficient arrangement, the miner is most perfectly and completely protected against being precipitated down the shaft in case of the cable breaking or becoming detached. At the top of the cage is an apparatus which operates something like a pair of ice hooks, except that the force exerted is outward and against the guides on either side of the shaft. While all is going right these clampers do not act, but the moment the cable breaks they spring out and fasten into the guides. The greater the weight upon the cage the tighter they clutch. For our special edification, Mr. Berry, the gentlemanly foreman of the mine, took us on the cage, and going down to the third station, 195 feet below the surface and nearly 300 from the bottom, landed us there and gave us a practical demonstration of the utility and perfection of the safety apparatus. Sending the cage to the bottom; he brought up on it a car containing nearly a ton of ore. When it had ascended to the spot where we were standing in a niche in the side of the shaft, he suddenly, at a single blow with a broad-axe, cut the cable. It seemed almost impossible that the cage and loaded car it contained should not be precipitated to the bottom of the shaft, yet it only fell—by actual measurement—four inches. On being cut, the cable, stretched taut, bounded up some feet, while the cage, after an almost imperceptible movement downward, remained stuck fast in the midst of the shaft, between heaven and earth as it were, by its eyebrows *alias* the clampers, or safety apparatus. On the cable being attached again, up the whole thing went as though nothing had happened. The miners are all much pleased with an invention which renders them so secure against loss of life and limb while ascending from or descending into the depths of the mine.

THE MINE OF PRECIOUS STONES, which our Mokelumne Hill correspondent described, a few weeks since, as existing on Stockton Hill, appears to be attracting continued, if not increasing attention. Great numbers of people from a distance are daily visiting the vicinity, and a large number of claims have been taken up. According to the Amador *Ledger*, stones have been found worth as high as $2,000. As there are similar geological formations in various parts of the State, we may soon expect to hear of like discoveries in other localities. The editor of the *Register* has seen some of the opals and says they are found imbedded in lava or cement, and are of a lightish color. When cut, they make a fine stone for a ring or breastpin. One which had been cut contains a miniature landscape view within it, looking as if it had been painted there. The entire hill has been taken possession of by different parties.

THE PARAGON is the name of a new petroleum company which has been organized in this city, the past week, to bore for oil in Mattole Valley, Humboldt county. The ground held by this company is said to adjoin that of the Union Mattole Company, which, last week, was reported to have struck oil in their well. The Trustees of the new company are Thomas C. Duff, Robert Kirk and W. H. Tobey. Capital stock $600,000, in 6,000 shares of $100 each.

The Monroe Petroleum Company has also filed its certificate of incorporation. Capital Stock, $6,000, divided into six thousand shares of $1 each. The Trustees for the first three months are G. C. King, F. Kirk, J. D. Ramsey, F. R. Wilson, W. L. Bromley.

THE HUMAN SYSTEM.—Horses intended for fast work are not allowed to accumulate fat. A horse designed for a trotter should neither be allowed to lose or gain flesh. So with man after he arrives to adult age. The amount of food should be calculated in proportion to the physical labor performed. By such a course no waste of the system will be experienced from labor—nourishment and labor being equally balanced; the two may be as readily adjusted to each other's requirements as fuel to the performance required of a steam engine.

IT is said that a pure quicksilver mine [?] has recently been discovered in Spain.

BITUMINIZED PAPER PIPES.

Bituminized paper pipes for conveying water, if we mistake not, are a French invention, and were first introduced at Paris in 1851. Ten years afterwards these pipes were taken up, and were found to be in as good condition as when laid down. The well known property asphalt, to resist oxydization, is an important circumstance in favor of the use of bituminized paper pipes as a substitute for iron for underground purposes. This pipe, as now manufactured, consists of a mass of layers of stout paper, cemented by an artificial bitumen, so as to form pipes of different sizes, which is internally glazed by a compact, brilliant coating of bitumen and earths, as a protection from the action of water, a diminution of friction in fluid passing, and to prevent incrustations or deposits. Experiments show that the exterior of the pipe is not acted upon by moisture or water; and it is known that bitumen is one of the most permanent bodies when buried in the earth, or surrounded by decaying matter.

Albert Stanwood, Esq., late superintendent of the Cochituate Water Works, of Boston, states that in May, 1863, he was furnished with a piece of bituminized pipe, of Boston manufacture, for the purpose of testing its relative strength as compared with iron; and, under his own observation, he found it to sustain the enormous pressure of 500 pounds to the square inch, without destroying or injuring the pipe. For all practical purposes the maximum test for iron pipes is 250 pounds to the inch—equal to 543 feet head of water. He also submitted it to a most thorough test as to whether or not it would impart any taste or impurity to water, and found, after six weeks' trial, that it did not in the slightest degree.

According to the *Practical Mechanics' Journal* of London, experiments recently made in Hanover, with bituminized pipe of French manufacture, gave a resisting power of more than twenty-four atmospheres, equal to a column of water about 800 feet high; similar experiments in Paris withstood a pressure of 500 pounds to the square inch, or upwards of thirty-three atmospheres, equal to a column of water 1,000 feet in hight! In making these trials, not only a single length of pipe were used, but several joined together were also tested. Mr. Samuel Hughes, civil engineer of the city of London, and others, testify that the resistance of these pipes to external pressure is so great that they can withstand the pressure of any depth or any character of soil, under which they may be laid.

Bitumen being a non-conductor, protects the water from excessive cold in winter and in summer from heat. The same peculiarity leaves the length of pipe unchanged from expansion or contraction by change of atmosphere—a matter of some importance, sometimes, when a great length of pipe is employed above ground. This description of pipe is entirely free from destruction or obstruction by oxyd, and from noxious chemical alterations in water; neither, according to the authority already quoted, is there the least impurity imparted to the water in its passage through them, nor are they affected by acids or alkalies, which often exert a most deleterious effect upon metal pipes of iron, copper or lead.

Another circumstance connected with these pipes, one which must have a bearing of peculiar importance in California, is their specific gravity, which, compared to iron pipes, is as one to five, and much greater when compared to lead. This quality greatly facilitates transport and handling. They are manufactured in England, at one-fourth the cost of lead and one-half that of iron, of the same dimensions, while the cost of transport is as one to five in iron and less still in lead. In conclusion, it may be mentioned that the laying down or putting up of bituminized pipes, and subsequent repairs, is less expensive than iron. The sections are readily and firmly joined. Air pipes for mining purposes, are made very cheap and light, and yet serviceable. The introduction of this description of pipes in California would seem to be a very desirable end. We are not aware that it has been done, as yet, to any great extent.

YIELD OF THE WASHOE MINES.

The State of Nevada taxes mines and requires a quarterly statement of the yield. The following is a statement of the mines in Storey county (which includes Virginia and Gold Hill), for the quarter ending March 31st:

COMPANY.	TONS.	AV. YIELD.	GROSS VAL.
Baccon M. & M. Co.	2,749	$23 66	$18,360 71
Belcher Mine	4,580½	69 05	314,139 31
Crown Point	1,043	34 83	36,331 00
Confidence G. & S. M. Co.	2,864	32 70	90,831 90
Bowers' Mine	1,300	47 50	61,750 00
Eclipse M. & M. Co.	1,572	35 34	55,588 05
Challenge Mining Co.	1,526½	33 94	51,799 44
Gould & Curry Co.	9,041	52 78	477,183 98
Imperial Co.	6,397	31 47	201,304 55
New York & Nevada Co.	1,454	28 30	41,950 98
Ophir Co.	2,455	25 48	57,712 20
Piute Co.	2,483	30 49	76,057 85
Potosi	9,068	33 90	308,120 92
Savage Co.	14,480	42 06	608,319 00
Uncle Sam Co.	150	50 72	4,608 00
C. C. Stevenson & Co.	336	24 78	8,319 72
Yellow Jacket M. Co.	19,301	37 50	720,107 54
Mexican Co.	60	300 00	18,012 00
Apple Co.	330	28 00	9,240 00
Empire Co.	3,412	34 94	119,208 49
Chollar Co.	11,000	40 00	440,000 04
Total tons	95,326	Value	$3,748,836 00
Average value per ton			$39 34

In the above there is no report from the Central, California, Kinney, White & Murphy, Dick Sides, Hale & Norcross, or Bullion—all of them producing mines on the Comstock lode. There are also quite a number of mines in and about Virginia City and Gold Hill, not on the Comstock lode, and not enumerated above, yet which produce quite an amount of bullion. The exhibit, for a partial one, is highly favorable for the bullion yield of Washoe, and would seem to lead to the conclusion that we may look for quite an increase in the yield of the present year. In connection with the above, we would give the following suggestive paragraph, from a correspondent of an evening cotemporary:

Tabular statements are being constantly placed before us showing the cost per ton of raising and working the ores at Washoe. The primary object appears to be the reduction of the ore at the least cost per ton. A business proposition so simple, and apparently so correct as this, one should not dare to challenge were it not noticeable that the companies which raise and reduce ores at the least cost per ton are precisely those that pay the least profits per ton to the shareholders; and that those which spend the most money on the ton of ore make a ton of bullion far cheaper than those who spend the least. We must necessarily leave the discussion of these facts and their bearing on mining economy to the much abused trustees and superintendents, not doubting that they will do their duty as far as their knowledge of the things they handle will allow them.

THE SUCCESSOR OF COBDEN.—It must be gratifying to every intelligent American to learn that the successor of Cobden, in the British Parliament, is a true and sincere friend of liberal principles, and decidedly opposed to the British Tory interest, which has proved itself so antagonistic to our Government in the war of rebellion just closing. The town of Rochdale, from which the member is returned, is a manufacturing place in the county of Lancaster and contains a population of about 25,000. Two candidates were in the field for the succession, Potter, a Whig, and Brett, a Tory. The contest was spirited but decisive; Potter being the winner. The speech of Brett at the "Hustings" was marked by strong demonstrations in favor of the Southern rebels; and that, too, after the news of the capture of Richmond had reached England. Potter avowed himself strongly in favor of our national unity and Government. After his election had been declared he expressed his thanks to the people in a neat and appropriate speech, from which we extract the following:—

I congratulate the men of Rochdale, the people of England and the friends of human progress all over the world on the glorious news from the other side of the Atlantic. I congratulate the friends of popular government on the success of the Federal cause. I congratulate the workingmen and workingwomen of Rochdale and this great district on the prospect, ere long, of having plenty of cotton, sustained by the the blood of the slave. The proudest aristocracy in the world have had to bow down before the offended majesty of a great people. Let this warning not be lost to the proudest aristocracy in Europe, and let them remember that the maintenance of wrong to a great people is as unsafe as it is unjust.

THE editor of the Santa Cruz *Sentinel* says that during his seventeen years' experience of California earthquakes, he has never felt one so severe as that which occurred in Santa Cruz on the 24th ult.

THE APPROACHING INDUSTRIAL EXHIBITION.

The people of the Pacific coast cannot commence too early in their preparations for the Great Industrial Exhibition, which has been announced to take place in Angnst next, under the management of the Mechanics' Institute of this city. It has been truly said that every new development of Science or Mechanics may be looked upon as the opening of a fresh mine of wealth, awakening moral industry and sagacity, and giving active employment, as it were, to new capital of mind; and among all the instrumentalities which have been devised by human genins for accomplishing snch results, we know of nothing which has been more potent than the exhibitions of industrial products, which have formed such a marked feature of the last thirty years of the world's history. Such exhibitions present, in a manner most remarkable and expressive, a true exemplification of the progress and existing state of human industry, and the efforts of the mind to grasp new ideas and devise improved facilities for meeting our physical wants.

We perceive in these exhibitions the fullest attainable illustrations of the application of science to all the various purposes of use and ornament; we discover in them how far man has advanced in his discoveries of the physical agencies which determine the nature of matter and the productions of Nature by which he is surrounded; we secure by them important advantages to the great masses of the community, by inducing them to give an amount of intelligent and careful attention to scientific and really useful objects, which, without some such stimulus, could not be elicited; there is promoted, through them, by carefully stimulated competition, a wholesome influence in directing the mental and physical exertions of the people into channels of active and useful effort; and, finally, by such exhibitions a moral influence is exerted over the community at large, elevating and ennobling in the highest degree; for a striking parallel has been observed to exist between the religious advancement of the various nationalities and the state of science and manufactures therein prevailing—fully establishing the interesting fact that a nation's religious privileges and position hold an intimate connection with its productiveness and power.

It is a wise dispensation of Providence which binds man to man, and renders each one of the species dependent upon another. It is this which forms the foundation of social intercourse, of civilization and of commerce. Commerce, civilization and agriculture act and re-act, the one upon the other. Without commerce and social intercourse we should have no civilization; so, a community entirely self-dependent, must retrograde more or less rapidly towards barbarism. Such a community could not exist, for it would be at variance with the immutable laws of nature.

Let us, then, in the furtherance of this great idea, gather together at the approaching exhibition tangible evidences of our mechanical skill and producing capacity, to the end that, by comparing notes, interchanging ideas, and presenting the incentive of reputation and reward, we may give a new impetus to arts and manufactures in California. The exhibition will no doubt be more complete and varied in its character than any one which has heretofore preceded it on this coast. Its details must of course be carried ont by the personal and active exertions of the people, for whose benefit it has been designed. Wells, Fargo & Co., have extended their usual courtesies, and offered to forward, free of charge, all articles designed for exhibition. Such articles should be carefully put up and marked "For the Industrial Exhibition," when they may be left at any of the interior offices, from whence they will be duly forwarded to this city.

We trust more attention, than heretofore, will be paid to the display of minerals. The exhibition, in this particular, last year, was meagre in the extreme. With the richest mineral region on the globe, and with a most admirable system of free communication, it is a shame that so little attention should be paid to this department. We trust a different record will be made the present season. It is for the interest of the various mining localities that a full exhibition of our mineral resources should be presented. The display will be seen and compared by people from different sections, who will carry home reports of what they have seen, and thus, to a great extent, manufacture a public opinion with regard to the localities represented. Let the miners and others interested see to it that a proper representation is made, in order that the record may be such as will be creditable. The people of California everywhere, whether in the valleys or the mountains, are deeply interested in the development and success of our mines. It is upon them chiefly that we are all dependent. Many strangers from abroad—sojourners among us for a season—will probably visit the exhibition during its continnance. Let us see to it that we present them as full an epitome as possible of our resources and industry.

The proprietors of this paper have again made application for the privilege of publishing a daily edition of their paper at the Pavilion during the continuance of the Exhibition, which it is desirable should form the second volume of the Daily Fair Press. Should the request be granted we shall make arrangements to make our reports more full and complete than they were a year ago. The advantage and usefulness of a paper of this description, which shall present, in a convenient and limited space, a faithful description of the display of the enterprise and genius of our people—the gathering together for comparison and profit, of the products of our industry, and the efforts of our thoughts, must be apparent, not only to the management of the Exhibition, but to the people at large, as well.

Rich Quartz in El Dorado.—The Placerville *News* of May 28th, says:

George Lord has shown us some very rich gold-bearing quartz from a vein lately discovered by him in the vicinity of the new El Dorado mill. As the vein was only found a few days since, little work has yet been done upon it, but the vein seems to enlarge as it decends. The pieces shown us are so immensely rich that a ton of the same sort would yield over $1,000, and the vein throughout will average at least $150. It has already been traced and located for upwards of a mile.

The above discovery was made by Messrs. Hodge & Co., and is doubtless one of much value. The location is about half a mile north of Placerville toward Poverty Point, and near the new El Dorado claim.

A Cooking Academy is among the latest of the fashionable novelties in New York city, and it is said to have proved a decided success. Fashionable young ladies are there taught to be accomplished cooks, so as to enable them, when necessary, to take a personal supervision of the kitchen. It is to be feared, however, that few of the graduates of that *alma mater*, will even condescend to cook a "square meal" for their liege lords, unless compelled to do so by pinching want. The province of Bridget will doubtless still continue, even in Gotham, an almost *terra incognita* to all professionally educated cooks.

Austin vs. Aurora.—According to the Esmeralda *Union*, there is a strong tide of immigration going on from Aurora to Austin, Reese River. The *Union* seems to think the former place is in a fair way to become depopulated.

Architecture in California.—The new banking-house in progress of construction for the Bank of California, on the site of the old Tehama House, when completed, will not be surpassed by any banking-house in the United States.

John Church & Co. have disposed of the Virginia *Union* to a company of practical printers. The new firm is O. E. Jones & Co.

The Mansion House, recently burned at San Jose, was the oldest hotel in the State, having been built in '49.

A. C. Latta, inventor of the steam fire engine, died at Cincinnati on the 29th of April.

COMMENCEMENT DAY AT OAKLAND.

Oakland was all alive on Tuesday and Wednesday last, with the literary ceremonies attendant upon the annual meeting in that place of the California *Alumni*, and the exercises connected with the Second Commencement Day of the College of California. The idea of an organized association of all College graduates upon the Pacific Coast, which was first conceived last year, was a most happy one, and we predict that ere long, its annual return will become one of the most interesting and important periodical gatherings in California. The lovers of science and literature who have wandered to this Western Coast, had already began to feel yearnings for the old hearthstones of their Eastern *Alma Matres*, where they had been accustomed to gather at their annual reunions, when the plan of this general association, here, was broached. It is in the remembrance of many with what warm and welcome greetings the proposition was met a year ago. On Tuesday morning last, they again met with an increased zeal and interest in the idea, and fully organized themselves into a permanent association, which will hereafter be known as the "Associated Alumni of the Pacific Coast." Rev. John W. Dwinelle, of Sacramento, was elected President, and Prof. M. Kellogg, of Oakland, was chosen Secretary. The exercises of the day consisted of an oration by the Rev. Mr. Stebbins, and a poem by Edward R. Sill, Esq., a graduate of Yale, followed by a banquet at which the "feast of reason and flow of soul" formed the chief features, as they should do, on all such occasions. The want of space will not admit of our making any extensive untice of these proceedings; suffice it to say that they were just what they should be, and met the fullest expectations of all.

The College exercises on Wednesday were eminently creditable, both to the Institution, and to the young gentlemen who made up the graduating class. A large number of ladies and gentlemen were present, both from this city and from Oakland, who were all highly gratified with the proceedings. This was the second graduating class, and consisted of four in number. The following programme was carried out:

"Salutatory," in Latin—Elijah Janes, Oakland.

"A Liberal Education"—George Edward Sherman, Colusa.

"The Nineteenth Century"—Gardner Fred. Williams, Oakland.

"The True Victory"—Elijah Janes, Oakland.

"The Reflex Influence of Language," with the Valedictory Address—John Raglan Glasscock, Oakland.

Poem, by Wm. L. Crowell, Esq.

Address by Prof. Henry Durant.

The following degrees were conferred: Oscar L. Shafter, LL. D.; Rev. M. C. Briggs, D. D.; W. H. L. Barnes, John Swett, Samuel I. C. Sweezy, John Bidwell, A. A. Sargent, Delos Lake, S. H. Parker, Honorary Degree of Master of Arts.

The students at this institution are rapidly increasing in numbers, fifteen young gentlemen having already passed a successful examination for entrance into the Freshman class of the ensuing year.

Reward Offered.—Mr. Webber of the Montezuma Ledge, Humboldt county, Nevada, offers a reward of $500 for a process to extract seventy-five per cent. of its assay in silver from the ore of the Montezuma ledge—the base being principally galena. There's a chance for scientific people!

We call attention to the advertisement to be found in our columns to-day, of a series of Lectures on Electricity, Magnetism and Psychology, by Dr. H. A. Benton, at Dashaway Hall. Those who are interested in the investigation of the subjects will do well to make it a point to be present at the opening lecture.

The Overland Immigration.—It appears to be universally conceded that the overland immigration the present season will be in excess of that of any previous period. This is due to the large number of men, fresh for new adventure, which the termination of the war has left unemployed.

ASSESSMENT AND SALE LIST

OF CLAIMS IN

VIRGINIA AND GOLD HILL DISTRICTS.

CORRECTED WEEKLY FROM LATEST DATES OF THE TERRITORIAL ENTERPRISE.

Canvassing Agents.

We would call attention to the following named agents of the Mining and Scientific Press as gentleman worthy of the countenance of any community which they may visit, and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the Press, will be acknowledged as a personal favor to us:—

Mr. Robert Lattimore—Amador and Alpine counties and the State of Nevada.

Thos. Poyzer, of Grass Valley, for Nevada, Yuba and Sierra counties.

Desulphurizing.—The following is Prof. Ed. N. Kent's new process of desulphurization as reported in the *Commercial Advertiser* of New York.

"The ore is ground in the ordinary manner, then mixed with a solution of salt in water to a consistency of dough, then pressed in the form of bricks or slabs by any suitable moulds; then, being hard enough to retain their form, they are piled up in a manner similar to bricks, in an ordinary brick kiln, and a fire built beneath them. The heat from this source, aided by the presence of the salt, derived from the salt water, will decompose the sulphurets, making sulphate of soda and chloride of the base metals, and leaving the gold entirely free from its combination, so that there is nothing left to interfere with the ordinary process of mechanical separation.

"A merit quite apparent in this process is the fact that no ovens with separate fires are necessary for the desulphurizing of a large amount. The quantity of ore capable of being piled up in an open yard, in the form of bricks, is, of course, unlimited. That the desulphurization must be perfect, seems to be secured by the intimate mixture of salt (chloride of sodium) with the pulverized ores. Any other method than dissolving the salt in water, would hardly effect this desirable result. This process, however, like every other, must stand the test of actual trial at the mines, where all the conditions necessary to success are encountered."

CUMULATIVE POWER PRESS
AND
ARROW TIE.
E. C McCOMB, Agent.
No. 1 Government House, cor. Sansome and Washington sts.
23v10 3m

DR. H. A. BENTON
WILL COMMENCE A SERIES OF LECTURES OR Conversations, on Monday Evening, June 12th, at
DASHAWAY HALL!
Subjects: **Electricity, Magnetism, Psychology;** their philosophy and uses, and particularly as a HEALING agent, if properly applied.
Will illustrate by Psychological experiments, the power that may be excited over the mind, making many very curious and amusing experiments, upon persons found susceptible in the audience.
Skeptics will have an opportunity to investigate and be convinced, and spend an hour profitably.
Admittance for Gentlemen, Fifty Cents; Ladies and Children FREE.
Rooms for treatment, 109 Montgomery street. 23v10

SAVE YOUR BOILERS AND FUEL.
ONE-EIGHTH OF AN INCH OF DEPOSIT ON THE fire surface of a boiler takes THIRTY PER CENT. of the steam generating power from that boiler, and, of course, wastes thirty per cent. of the fuel; and, what is a greater misfortune, it keeps the water from the plates and flues, causing them to scorch, blister and burn, destroying the boiler, and too often human lives.
On the receipt of Ten Dollars, I will give information of a remedy that I have used with complete success in every instance, and without delaying the running of machinery, or injuring the boilers in any manner, and at a cost of five dollars the boilers can be made as clean as when they were new.
Apply by letter, or personally, to
JOHN MAILER,
Engineer of Pioneer Flour Mills, No. 515 Market street, above First (opposite the Oriental Hotel), San Francisco
23v10

NOTICE TO MINERS.
THE UNDERSIGNED WILL SELL
MINING STOCK
In Incorporated Companies and Unincorporated Mines, in San Francisco District and in El Dorado District, Arizona Territory. It is confidently asserted and believed by most practical miners that Arizona is the richest mining country in the world. Recent developments of these mines are now attracting the attention of capitalists, who have already erected several mills, and more are going there soon. Now is the time to invest to advantage, and obtain the rise that must soon follow. Those wishing to purchase soon can do so, on most liberal terms, by calling on MR. RODNEY CLARK, 338 Montgomery street (room No. 11), San Francisco, or on H. C. SKINNER, San Jose, California.
N. B.—Freight all the way by water at a cost of 4½ cents per pound.
H. C. SKINNER,
San Jose, California.
San Francisco, April 27, 1865. 17q10

1852. 1865.
Thirteenth Year of Publication.
THE GOLDEN ERA.
Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

Liberal Terms to Clubs.

THE GOLDEN ERA is furnished to CLUBS at the following rates: Three Copies, one year, Ten Dollars; Five Copies, one year, Fifteen Dollars; Ten Copies, one year, Twenty five Dollars. An extra copy will be forwarded, free, for one year, to the person sending a club of five or ten subscribers.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

IN THE GOLDEN ERA,
"THE FAIR LILIAS;"
Or, "LIFE IN DEATH,"
A New Story, by PIERCE EGAN, Author of "The Poor Girl," "The Flower of the Flock," "Lady Maud," "The Snake in the Grass," "Such is Life," Etc.

PIERCE EGAN is undoubtedly the most fascinating and attractive Novelist of the age. His stories are eagerly sought for, read and admired by hundreds of thousands in England and America. "THE FAIR LILIAS; or, Life in Death," surpasses, in exciting interest and thrilling situations, all of the productions of the celebrated author, and is Pierce Egan's masterpiece.

THE GREAT SERIAL,
"OUR MUTUAL FRIEND,".....By Charles Dickens.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA
Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

BROOKS & LAWRENCE,
GOLDEN ERA BUILDING,
No. 543 Clay street, near Montgomery, San Francisco.

UNASSESSABLE.

First National PETROLEUM COMPANY.

Organized under the Laws of the State of California, March, 1865.

CAPITAL STOCK,....$1,000,000,

Divided into 200,000 Shares of $5 Each.

OFFICERS:

HON. J. E. VINTON.....President.
A. W. STRATTON.....Treasurer.
D. S. CUTTER.....Secretary.

TRUSTEES:

J. E. VINTON, W. H. TOBEY, A. W. STRATTON, W. B. EWER, M. C. CONROY.

Office: At W. H. Tobey & Co.'s Petroleum Agency, Room No. 28 Government House, SAN FRANCISCO.

This Company issues none but UNASSESSABLE STOCK. This Company's ground is developed by a special fund, derived from sales from a reserved amount of stock set apart by the Company for such a purpose

This Company has secured SIX HUNDRED AND FORTY ACRES OF LAND, in Tulare county, California, in the midst of one of the most valuable oil regions on the continent. One of the largest flowing oil springs in the State is located upon the ground, over a large extent of which oil may be found by sinking open shafts to the depth of ten or fifteen feet.

The lands were selected by the same parties who assisted in locating the well known "Buena Vista Petroleum Company," which company it adjoins on the south.

One hundred gallons of crude oil have already been received in this city from the Buena Vista Company, upon whose grounds a flowing well has been struck at a depth of fifty feet. This oil may be seen at the laboratory of Prof. E. Benoist, at 643 Third street, San Francisco. From it has been distilled as pure an article of kerosene as can be found in the city, samples of which can be seen at the office of the "FIRST NATIONAL PETROLEUM COMPANY," Room No. 20 Government House, in this city.

DEVELOPMENT.

The Company has already entered into a contract with parties who will start the coming week with suitable tools for developing the property. The Company rests its claim to confidence solely upon the intrinsic value of its property, and feels the utmost assurance that its development will realize their most sanguine expectations, and enable it to take rank, at an early day, as a dividend-paying concern.

We would again call the attention of the public to the fact that when you have purchased stock in this Company there can be no assessments coming upon you—that no "freezing out" can be attempted by large stockholders upon smaller ones.

THE CONTINGENT FUND,

From which all expenses are paid, is derived from sales of a reserved fund of ten thousand shares of unassessable stock, whose par value is $50,000. The prospectus and map of the Company's location can be had on application to the Secretary, at his office, Government House, cornor Sansome and Washington streets, San Francisco.

Only two thousand shares of the contingent fund is now the only stock in the market for sale, and the proceeds derived therefrom will be appropriated for the purpose designed. The Company are sanguine that they will be able to produce oil in this market from a flowing well upon their claim inside of six weeks, upon which accomplishment there is every reason to believe that the stock will be worth its par value.

San Francisco, April 7, 1865. 14v10

WHAT MAY BE DONE WITH OLD RAGS.—There is a church actually existing near Bergen, Prussia, which can contain nearly one thousand persons. It is circular within, octagonal without. The relievos outside and the statues within, the roof, the ceiling, the Corinthian capitals, are all of papier mache, rendered water-proof by saturation in vitrol, lime water, whey and white of eggs. We have not yet reached this audacity in our use of paper; but it should hardly surprise us, inasmuch as we employ the same material in private houses, in steamboats, and in some public buildings, instead of carved decorations and plaster cornices. When Frederick II. of Prussia set up a limited papier-mache manufactory at Berlin, in 1765, he little thought paper cathedrals might, within a century, spring out of his snuff-boxes by the slight of-hand of advancing art. At present, we, who haunt cathedrals and build churches, like stone better. But there is no saying what we may come to. It is not long since it would have seemed as impossible to cover seventeen acres of ground with glass as to erect a pagoda of soap bubbles; yet the thing is done. When we think of a psalm sung by one thousand voices pealing through an edifice of old rags, and the universal element bound down to carry our messages with the speed of lightning, it would be presumptuous to say what can and what cannot be achieved by science and art under the training of steady old Time.

MELTED ICE is as pure as distilled water. During congelation the salts and impurities are eliminated. Sea water, when frozen furnished pure spring water on being melted; and in the north of Europe, salt is economically extracted from sea water by exposing the water to intense cold; the water which remains unfrozen and unfreezable is then extremely rich in salt, which may easily be obtained by evaporation.

For General Use,

BY GIUDO KÜSTEL,

Mining Engineer and Metallurgist—Formerly of the Ophir Works,

IN ONE HANDSOME OCTAVO VOLUME.

SYNOPSIS OF THE WORK.

PART FIRST.

Chapter 1st—Treats of the methods of recognizing silver and gold ores, and contains a "Systematic Proceeding" for their determination by blowpipe analysis readily learned and practised, and is a reliable and accurate guide.

Chapter 2d—Is a description of gold and silver ores, describing many interesting occurrences in minerals belonging to the Comstock, Gold Hill, Humboldt, and Arizona Mining Districts.

Chapter 3d—Describes the requisites and approved methods for testing and assaying—with illustrations.

Chapter 4th—Speaks chiefly of the extraction of gold, especially the amalgamation treatment of ores in batteries, pans and arrastras: and also the extraction of gold by chlorination.

Chapter 5th—Is replete with valuable information on the extraction of silver, including divisions of processes employed. The behavior of chemicals by the wet process; the same when calcined—with valuable hints to attendants roasting ores. Full description for the cold and melting processes, etc.

Chapter 6th—Makes mention of the most modern utensils and machinery, such as pans, agitators, furnaces, etc., with comprehensive diagrams.

PART SECOND.

ON GENERAL METALLURGY.

Chapter 1st—Treats of many species of argentiferous ores; the dry assays of rich and poor ores; also, the same by the humid and dry methods.

Chapter 2d—Presents a clear and comprehensive description of the extraction of silver either by melting or amalgamating process—its dissolution and final precipitation—with divisions of the principal modes of extraction employed.

Chapter 3d—This last chapter gives full and precise formulas for the extraction of the metals in the dry way; the various modes employed in Europe and South America.

The "Amalgamation in pans" with chemicals, or dry method by calcination or roasting ores, forms the most valuable portion of the work; the same being thoroughly and distinctly described and explained, and particularly designed for the treatment of ores in Lower California, Arizona, Mexico, and other mining districts where argentiferous lead ores abound. No less valuable and important are the practical descriptions and illustrations of cupellation and refining of silver, and concentration of the same in lead, by the Pattinson and other processes.

This Work is invaluable to Prospectors, Miners, Metallurgists and Mill-men throughout the Pacific States, containing valuable formulas for the treatment of ores and minerals, expressly prepared in an authentic manner and a plainly written style, for persons engaged in mills in California, Washoe, Lower California, etc. It is also valuable to prospectors and miners unacquainted with mineralogy, having a full and clear chapter on Blowpipe Assays and Tests.

☞ That it may be within the reach of everybody, **the price has been reduced to FIVE DOLLARS**

EUROPEAN

METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

S. P. KIMBALL, J. R. MURPHY.

10v10

To Prospectors.

THE Directors of the San Francisco PACIFIC METALLURGICAL WORKS offer the following inducements to Prospectors:

NOTICE.—Knowing it will benefit our country to have it well prospected, we agree, if any party will forward us samples of minerals of any kind for assay, express paid, inclose TWO DOLLARS for the same, to return them a correct assay, with the best method of working, and feasibility of having the same worked in this city.

WHAT TO READ.—Are you deficient in taste? Read the best English poets, such as Gray and Goldsmith, Pope and Thompson, Cowper and Coleridge, Scott and Wordsworth.

Are you deficient in imagination? Read Milton, and Akenside, and Burke.

Are you deficient in power of reason? Read Chillingworth, and Bacon, and Locke.

Are you deficient in judgment and good sense in the common affairs of life? Read Franklin.

Are you deficient in sensibility? Read Goethe and Mackenzie.

Are you deficient in vigor of style? Read Junius and Fox.

Are you deficient in political knowledge? Read Montesquieu, the "Federalist," Webster and Calhoun.

Are you deficient in patriotism? Read Demosthenese, and the life of Washington.

Are you deficient in conscience? Read some of President Edwards' works.

Are you deficient in piety? Read the Bible.

Are you deficient in general information? Read the MINING AND SCIENTIFIC PRESS.

A PERSIAN POET says: "The heavens are a point from the pen of God's affection; the world is a bud from the bower of his beauty; the sun is a spark from the light of His wisdom; and the sky is a bubble on the sea of His power. His beauty is free from the spot of sin, hidden in the thick veil of darkness; He made mirrors of the worlds, and threw reflection from His own face on every atom."

A Valuable California Invention.

IMPORTANT TO OPERATORS AND DEALERS IN PETROLEUM, ETC.

CALIFORNIA

HERMETICALLY SEALED BARRELS,

—FOR—

TRANSPORTINO CRUDE PETROLEUM, KEROSENE, AND OTHER VOLATILE OILS.

WM. H. TOBEY & CO., having purchased the sole right of the United States and Territories to make and vend the above Barrels for the period of ten years, we are now prepared to enter into contracts with parties desirous of using such Barrels, to furnish the same, in any quantity, and at short notice. Samples may be seen at the office of Wm. H. Tobey & Co., Petroleum Agency, Room 23, Government House, San Francisco.

The above invention consists of a simple but effective preparation, which can be applied as a coating to any ordinary barrel of pine or hard wood, by which the same is rendered perfectly impervious to the most volatile substance known, thus rendering an ordinary barrel quite as safe a receptacle for Petroleum as a metal case, and at far less cost. Orders received as above by

WM. H. TOBEY & CO.

San Francisco, April 10, 1865. 17v10

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting machinery of the most approved construction, Flour, Saw and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superhented Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

A NEW STEAMER of 200 tons burthen, is being built at Hastings' Wharf, at the foot of Third street, by Mr. Mingo, for the Alviso and San Francisco trade. Her machinery is all of San Francisco manufacture, and the vessel is calculated to do credit to San Francisco workmen. She will be ready for launching in about four weeks. She is owned at Alviso.

MEXICAN AGENCY.—Those having business in connection with Mexico, are notified that an office has been opned at 536 Washington street, where they can learn anything they may wish concerning mining interests, or other matters connected with that country.

THE far-famed Josephine mill and mine, in Coso, were recently sold in Visalia at Sheriff,s sale, price $30,667.

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

"Say, why should man for thirst be given
If not for wine bestowed by Heaven
To quench such drought as mine?
Without it, I'm a fish on land,
A barren heap of parching sand—
Then give me joyous wine."—*Trinklied.*

Delicacy of flavor, exhilaration without intoxication, and every other desirable property belonging to the richly fermented Juice of the Grape, are to be found in the "Cerke Wine," from the celebrated Bosquejo Vineyard, Tehama county.

There is no wine produced in California that can bear comparison with this, and it would be difficult to find a European wine, of the same class, that can surpass it.

The vintage of 1862 is now offered for sale, in quantities to suit, by the Agent of the vineyard,

A. S. LOWNDES,

Machinery.

A CARD.

MR. H. S. JACOBS, formerly of this State and Oregon, adopts this method of calling the attention of his old friends and customers to the fact that he has established himself permanently in the city of New York, having, since his residence in California, perfected and secured by letters patent his celebrated WHEEL-MAKING MACHINERY, which not only materially reduces the cost of manufacture, but makes a much more durable and finished wheel than by the old method. These facts are simply attested by the large and increasing demand for Wheels made by this machinery, as well as by the numerous testimonials furnished by parties who have purchased and tested them. Having made large contracts for timber, selected expressly for this purpose by a gentleman who has had an experience of upwards of thirty-five years, and whose entire attention is devoted to the selection of stock connected with this branch of industry, and having had myself an experience of eleven years in manufacturing in California and Oregon, and being personally acquainted with the sizes, styles, material and wants of these States, I feel the most entire confidence in being able to supply the trade with a better and cheaper article than can be had from any other source, and in whatever quantity may be desired, having on hand at present one of the largest and best assorted stocks of Omnibus, Truck, Cart and Light Wagon Wheels, of all sizes, together with a varied assortment of Hubs, Spokes, Felloes, Bent Rims, Shafts, Poles, etc., to be found in the country—all made under my own supervision and of the very best material and workmanship. All descriptions of well-seasoned Timber kept constantly on hand and supplied in any quantity. Orders for material of all and every kind pertaining to Wagon manufacture will be filled promptly for cash on delivery.

Address, THE JACOBS PATENT WHEEL-DRESSING MACHINE AND WHEEL COMPANY, 99 Wall street and 145 and 147 Bank street, New York.

N. B.—Those desiring peculiarity of style in Hubs, Felloes, Spokes, etc., can be accommodated, and will receive our careful attention by sending samples of the same. [20v10

NOTICE.

The undersigned having purchased the EXCLUSIVE RIGHT in and for the State of California, for the

Manufacture and Sale of

WINHAM'S

PATENT HOSE COUPLING,

Hereby caution all parties against the manufacture or purchase of the above Hose Couplings, except through us, as any infringement will be prosecuted to the full extent of the law.

PRESCOTT & SCHEIDEL,

Marysville Foundry.

HANSCOM'S CRUSHERS,

Made in sizes suitable for Breaking Quartz for Batteries; Rock for macadamizing or concrete; Copper Ore for sacking, sampling, or concentrating; also, for crushing Quartz for Arastras and Grinders. The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water, or Steam Power. For further information address W. W. HANSCOM.

1 Golden State Iron Works, San Francisco.

HUNT'S PATENT

Circular Sweep Horse-Powers,

For running Churns, Washing Machines, Grindstones, pumping water, sawing wood, and other light machinery. Price, $100, at the Factory.

HUNT'S PATENT SELF-REGULATING TREAD HORSE-POWER is superior to any machine of the kind in the market. Price, with Governor, all complete to set to work, at the Factory, $300. Manufactured by

E. O. HUNT,

17v10 28 Second street, San Francisco.

THE HAMMER QUARTZ MILL.

[PATENT APPLIED FOR.]

This Machine is now complete and ready for sale. In constructing it, our aim has been to produce a light, cheap and economical Crusher—one adapted to mining on a small as well as on a large scale.

The elementary principle on which it operates is that of the stamp—the only one really reliable and economical.

But the stamp has many serious disadvantages, among which are its great weight and small velocity; the great power required to run it; difficulty in feeding properly; imperfect discharge, and the necessity of crushing wet, or the annoyance from dust in crushing dry.

All these difficulties are obviated in our machine, and the percussive blow of the stamp retained, with the further advantage of its being a drawing or grinding one.

We give to our hammers such absolute or relative weight and velocity as we choose—just such as to effect their purpose and no more—thus securing the qualities of the natural hammer blow.

The feed is self-adjusting and uniform, and as fast as the ore reaches the required degree of fineness (which depends upon the fineness of the screen or sieve used), it is instantly discharged, so that there is no packing of the ore under the hammers.

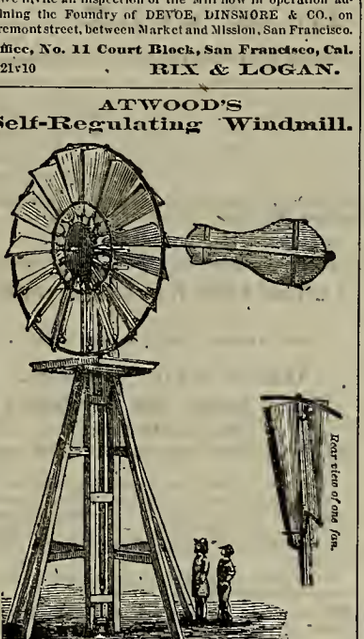
The mill crushes dry, with no more dust than that incident to feeding, which is trifling.

As the only support of the mortar is a single post set into the ground, the machine can be put in place at slight expense.

The size now being built weighs about 1,800 pounds complete; the heaviest piece not weighing over 275 pounds. It is driven by half a horse-power, and crushes from three to ten tons per day of twenty-four hours per day, according to the character of the rock and the fineness to which it is reduced.

PRICE,.....$800.

Larger ones will be furnished if desired.



We invite an inspection of the Mill now in operation adjoining the Foundry of DEVOE, DINSMORE & CO., on Fremont street, between Market and Mission, San Francisco.

Office, No. 11 Court Block, San Francisco, Cal.

21v10 **RIX & LOGAN.**

ATWOOD'S

Self-Regulating Windmill.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,

SAN FRANCISCO.

N. B.—We also manufacture DICKINSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

HUNT'S

IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

HORSE POWER

For Sawing Wood,

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

PETROLEUM OIL WELLS.

HENRY STEELE,

MANUFACTURER OF ALL SIZES OF

Tools for Well Boring.

Having had long experience in this line, I am prepared to fill orders promptly and at low rates. No. 107 Leidesdorff street, between California and Sacramento, San Francisco. 21v10-1m

SALMON'S

PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Millers and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this amalgamator, and assayed by Miller & Lunbaum, at Austin, Nevada:

	No.	Fine		No.	Fine
Assay	259	943	Assay	300	990
Assay	285	941	Assay Ozokman		980
Assay	286	940	Assay Water Rock		966
Assay	291	950	Assay Water Rock		998
Assay			St. Helena Ledge, W. D.		966

These, including a hundred other batches, were all worked to within fifteen per cent., and some to within ten per cent., of the assay. Parties interested will find it to their advantage to call and see the above machine in operation. Manufactured at the San Francisco Foundry, San Francisco, California, by

J. & W. C. SALMON,

To whom all orders should be addressed. 15

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,

At the Novelty Iron Works, Nos. 37 & 39 Fremont street. 16-1m

BAUX & GUIOD'S

Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

Lapidaries' refuse, Refiners' ashes, Jewelers' sweepings, purchased or worked for a percentage. Ores and tailings worked or assayed at reasonable rates.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8

FARRAND'S

Oscillating Amalgamator,

RECEIVED THE

ONLY PREMIUM

AWARDED FOR AMALGAMATORS

At the Recent Industrial Fair

OF THE

Mechanics' Institute of San Francisco.

Committee of Awards.

O. BELDEN, W. T. GARRATT, H. P. WAGELEE,
O. OORI, GEO. JOHNSON, C. M. RADCLIFF.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall, and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, whilst the loss by trituration is comparatively nothing.

4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.

5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY.

W. D. FARRAND, Inventor,

R. L. OGDEN, Agent, SAN FRANCISCO.

S. E. corner Montgomery and California streets.

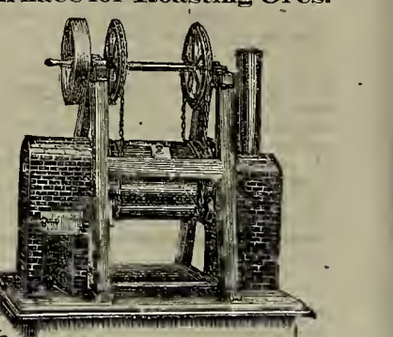
19v9

NOTICE TO MINERS.

NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard



Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, **B. FAUCHERY,**
Metallurgist. **Engineer,**

24v9

WM. BRUCKNER'S

Furnace for Roasting Ores.

Now in Operation at 416 Market street.

This Furnace, which is portable, and can be carried on mule-back, undertakes to roast without employing any labor whatever for the operation of stirring, which is accomplished by machinery that may be driven by steam or any other motor. It consists of an iron cylinder, which, being suspended by chains, in rotating mixes and stirs the ore, by an internal apparatus, quicker and more perfectly than can be done in any other furnace hitherto known in metallurgy. It can be applied to any kind of ore, and the rapidity and perfectedness of its operation, the great saving in fuel, and the entire saving of the labor usually required for stirring the ore, together with the small cost of constructing it, renders this furnace a most

Economical and Practical Invention.

The Furnace may be had of two sizes—one being nine feet in length and holding fourteen hundred pounds, and the other six feet in length, and holding eight hundred pounds. One horse power is required to drive the machinery of the larger sized furnace, and three-fourths of a horse-power for the smaller size. Parties wishing to erect such furnaces will please communicate to

W. BRUCKNER,

5v10 No. 416 Market street, San Francisco.

BLAKE'S

QUARTZ BREAKER

Is now extensively used for breaking hard masses of

Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

CALIFORNIA, AUSTRALIA,
WASHOE,
ENGLAND, FRANCE,
—AND—
THE ATLANTIC STATES.

These Machines, or circulars containing further information regarding them, may be obtained of the undersigned. Address,

BLAKE & TYLER,

Box 2077 San Francisco Post Office.

CHAS. T. BLAKE, Idaho City. E. TYLER, Michigan Bluff. WM. P. BLAKE, San Francisco.

4v10

VARNEY'S

PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, none has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v10 San Francisco.

Hepburn & Peterson's

AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos. 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Sellers' State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th. Illustrated in the Mining and Scientific Press, April 9th, 1864.] [HEPBURN & PETERSON.

And in accordance with law and an order of the Board of Trustees, made on the 5th day of May, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at the Secretary's office, on the 26th day of June, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

W. FELL, Secretary.

je10 Office, No. 53 Montgomery Block, San Francisco.

Caledonia Tunnel and Mining Company, Gold Hill District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 9th day of June, 1865, an assessment of three dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, No. 10 Government House, corner of Washington and Sansome streets, San Francisco or to James V. Coffey, Virginia, Nevada.

Any stock upon which said assessment shall remain unpaid on Saturday, the 15th day of July, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, July 29th, 1865, at 12 o'clock M., to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

je10 J. M. BUFFINGTON, Secretary.

El Dorado Gold and Silver Mining Company, Silver Mountain District, Alpine county, California.

ASSESSMENT No. 5.—Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 5th day of June, 1865, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company.

Any stock upon which said assessment shall remain unpaid on Saturday, the 15th day of July, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 31st day of July, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.
W. D. ROOT, Deputy Secretary.

Office, No. 410 Montgomery street, San Francisco.

NOTICE.—At the above meeting, assessment No. 1, levied July 8th, 1863, assessment No. 2, levied August 4th, 1863, and assessment No. 3, levied October 15th, 1863, of ten cents per share each; also, assessment No. 4, levied September 24th, 1864, of fifty cents per share, were rescinded, and stockholders having paid said assessments will be credited on the above assessment, No. 5, accordingly. Also, notice is given, that the additional amount of twenty cents per share (being properly assessment No. 5), was levied for the month of June, 1865.

J. WARREN CLARK, Secretary.
je10 W. D. ROOT, Deputy Secretary.

Lady Franklin Gold and Silver Mining Company, Silver Mountain District, Alpine county, California.

Notice is hereby given, that at a meeting of the Trustees of said company, held on the 3d day of June, 1865, an assessment of fifty (50) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold coin, to the Secretary, at his office, 305 Montgomery street, San Francisco, or to Thomas Peters, Silver Mountain, Alpine county, Cal.

Any stock upon which said assessment shall remain unpaid on the 8th day of July, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 28th day of July, 1865, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

J. S. LUTY, Secretary.
Office, 305 Montgomery street, San Francisco.
San Francisco, June 3, 1865. je10

Rose Gold Mining Company, Location, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 8th day of June, 1865, an assessment of fifty-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, No. 338 Montgomery street, (Room No. 12,) San Francisco.

Any stock upon which said assesment shall remain unpaid on Saturday, the 8th day of July, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 22d day of July, 1865, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

C. M. PECK, Secretary.

Office, No. 338 Montgomery street (Room No. 12), San Francisco.

A discount of fine (5) per cent. will be made on all moneys paid on account of assessments on or before June 29th, 1865. By order of the Board of Trustees.

je10 C. M. PECK, Secretary.

Silver Creek Gold and Silver Mining Company, Silver Mountain District, Alpine County, Cal.—Assessment No. 4.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 2d day of May, 1865 an assessment of one dollar and twenty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, or to S. A. HAWKINS, Superintendent, at Silver Mountain.

Any Stock upon which said Assessment shall remain unpaid on Saturday, the 10th day of June, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 24th day of June, 1865, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.
W. D. ROOT, Deputy.

Office, No 419 Montgomery street, San Francisco.

NOTICE.—At the above meeting of the Board of Trustees of said Silver Creek Mining Co., Assessments Nos. 1, 2 and 3, levied July 8, 1863, August 6, 1863, and September 22, 1863, respectively, were rescinded, and stockholders having paid said assessments will be credited on the above assessment (No. 4) with such amount so paid. Also, notice is given, that the above assessment (No. 4) of one dollar and twenty cents was levied for the months of February, March, April and May, 1865, being a levy of thirty cents per month on the capital stock of said Company for the aforesaid months, and in conformity with the by-laws of said Company.

J. WARREN CLARK, Secretary,
my6 W. D. ROOT, Deputy.

POSTPONEMENT.—The advertisement of stock delinquent on the above assessment is hereby postponed until Saturday, June 17th, 1865, and the sale thereof until Monday, July 3d, 1865. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.
je10 W. D. ROOT, Deputy.

Santa Cruz Petroleum Oil Works Company, location, Santa Cruz County, California.

Provisions and Blankets packed free of charge.

STAGES LEAVE CHICO EVERY MONDAY, WEDNESDAY and FRIDAY, via Susanville and Surprise Valley, for Ruby City, in the Owyhee and Boise mines.

This is the nearest and best route connecting California and Idaho, being less than one-third the distance by way of Oregon.

Passengers should secure Tickets before leaving San Francisco or Sacramento, so as to get off on the first stages departing after their arrival at Chico.

Fare from Sacramento to Chico, $11.

FRED. O. ROBINSON, Agent.
Office at American Exchange, San Francisco.

C. J. SHAW, Agent, Sacramento.
Offie corner K and Front streets (with California Stage Company). 22v10

Astonishing Illegality of Mining Advertising!

The amount of mining corporation advertisements now being published in certain daily papers of this city in an illegal manner, and containing plain and gross violations of the recent Act concerning assessments of corporations, is really astonishing.

ADVERTISING IN SUPPLEMENTS has been decided by the Courts of the State of New York (after whose code the laws of California were framed,) as absolutely void; and we have the best of reasons for cautioning every prudent company against that class of advertising. Furthermore, there are continually numberless errors or discrepancies occurring, through MIS-APPREHENSION OF THE LAW, on the part of advertisers.

We do not aim to raise unneccessary alarm, but simply perform our duty in admonishing parties interested against the storm of retribution, which is most surely awaiting the success of such companies as are now pursuing informal transactions, whether the same occur through carelessness, duplicity or ignorance.

The original bill for levying and collecting assessments, as first introduced before the last Legislature, we denounced as outrageous; as amended and passed, the Act is obnoxious and cumbersome to the mining community, and is rapidly preparing an enormous feast for the "legal fraternity" of this coast. Although very rigid, the law is no less specific in its main features, and when once minutely understood, its illiberal requisitions are very plain.

MINING COMPANIES and others connected with the Mining Interests of California, will find all possible desired information in the *Mining and Scientific Press* of San Francisco which is an ably edited Journal, smartly handled, and well up to the times. The Mining Companies of California, are awake to the advantages of having their Mining Notices, comprising Assessments, Dividends, Elections, &c., concentrated in the advertising columns of one Journal, as we notice in the issue of the *Press* of May 7th, there are no less than seven pages of this interesting matter.—*U. S. Mining Journal Railroad and Financial Advertiser, New York.*

BLASTING

POWDER.

And in accordance with law, and an order of the Board of Trustees, made on the 8th day of May, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at public auction, by Maurice Dore & Co., No. 327 Montgomery street, San Francisco, on Monday, the 19th day of June, 1865, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

W. W. KNIGHT, Secretary.

Office, 35 Exchange Building, corner Washington and Montgomery streets, San Francisco. my27

Evening Star Gold and Silver Mining Company, Trinity District, Humboldt County, Nevada.

Notice is hereby given, that a meeting of the Stockholders of the Evening Star Gold & Silver Mining Company, will be held at No. 410 California Street, San Francisco, on Monday, the 19th day of June, 1865, at 3 o'clock P. M., of that day for the purpose of altering the by-laws of the Company and of transacting other necessary business. A punctual attendance is requested, as subjects of importance to the Company will be presented. By order of the Board of Trustees.

N. DUPERU, Secretary.

Office, No. 710 Sansome street, San Francisco. je3

El Alamo de San Antonio Mining Company,
San Antonio Mining District, Lower California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held December 6th, 1864, an assessment of one ($1) dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, 514 Bush street, San Francisco. Assessments paid on or before the 20th instant, ten per cent. will be allowed on the amount so paid.

Any stock upon which said assessment shall remain unpaid on Tuesday, the 3d day of January, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Tuesday, the 17th day of January, 1865, to pay the delinquent Assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

THOMAS RUTHERFORD, Secretary.

SUPPLEMENTARY NOTICE.—In consequence of an omission to advertise the delinquent stock on the above assessment on the day set forth—namely, the 3d day of January, 1865—the said assessment is hereby re-published, as by law provided; and in accordance therewith, any stock upon which said assessment shall remain due and unpaid on Saturday, July 1st, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, July 15th, 1865, to pay said delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

THOMAS RUTHERFORD, Secretary.

And in accordance with law, and an order of the Board of Trustees, made on the 4th day of May, 1865, so many shares of each parcel of said stock as may be necessary, will be sold, at public auction, by Edwards, Olney & Co., at No. 626 Montgomery street, San Francisco, California, on the 19th day of June, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. J. JONES, Secretary.

Office, No. 728 Montgomery street, San Francisco, California. je3

Jewett Gold and Silver Mining Company
Works located at Gold Hill, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 22d day of May, 1865, an assessment of one dollar per share was levied upon the assessable capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 509 Clay street, in the city and county of San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 24th day of June, 1865, will be advertised on that day as delinquent, and unless payment shall have been made before, will be sold on Saturday, the 10th day of July, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

A. M. COMSTOCK, Secretary

Office, No. 509 Clay street, City and County of San Francisco, California. my27

Kern River Gold & Silver Mining Company,
Cove District, Tulare County, Cal.

The Annual Meeting of the stockholders of the Kern River Gold & Silver Mining Company, will take place at the office of the Company, No. 432 Montgomery Street, San Francisco, on Tuesday, June 20th, 1865, at 8 o'clock, P. M., for the purpose of electing Trustees to serve for the ensuing year, altering of by-laws and such other business as may come before the meeting. By order of the Board of Trustees. M. G. ELMORE, Secretary.

San Francisco, June 3, 1865.

Our Patent Agency.

THE PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

Kelsey Gold and Silver Mining Company, Kelsey District, El Dorado County, Cal., San Francisco, May 31, 1865.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 30th day of May, 1865, an assessment, No. 10, of 30 cents per share was levied upon the capital stock of said Company, payable on the 31st day of May, 1865, in United States gold and silver coin, to the Secretary, at the office of the company, No. 16 Drum street.

Any stock upon which said assessment shall remain unpaid on Saturday, the 1st day of July, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 15th day of July, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

S. C. GARDNER, Secretary.

Office at Messrs. Bemis & Edson's, 16 Drum street, between California and Sacramento streets. je3

And in accordance with law, and an order of the Board of Trustees, made on the 8th day of May, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at the auction rooms of Maurice Dore & Co., 327 Montgomery street, San Francisco, on Monday, the 19th day of June, 1865, at 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

W. W. KNIGHT, Secretary.

Office, 36 Exchange Building, corner Montgomery and Washington streets, San Francisco. my27

Whitlach Yankee Blade Silver Mining Company, Reese River Mining District, Lander county, Nev.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 26th day of May, 1865, an assessment (No. 1) of ten ($10) dollars per foot, was levied upon the capital stock of said Company, payable immediately, in gold coin of the United States, to the Secretary, at his office, No. 402 Front street (up stairs), San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Saturday, the 1st day of July, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 15th day of July, 1865, to pay the delinquent assessment, together with costs of Advertising and expenses of the Sale. By order of the Board of Trustees.

N. C. FASSETT, Secretary.

Office, 402 Front street, San Francisco. my27

Yankee Blade Tunnel and Colosal Silver Mining Companies, Reese River District, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Trustees of said Companies, held on the 1st day of June, 1865, an assessment of ten (10) cents per share was levied upon the capital stock of each of said Companies, payable immediately, in United States gold coin, to the Secretary, at his office, 305 Montgomery street.

Any stock upon which said assessment shall remain unpaid on the 1st day of July, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 20th day of July, 1865, to pay the delinquent assessment, together with the costs of advertising and expenses of the sale.

J. S. LUTY, Secretary.
305 Montgomery street.

San Francisco, June 1, 1865. je3

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

DEWEY & CO.,
Publishers and Job Printers,
Office Mining and Scientific Press, San Francisco.

WORSHIP GOD WITH FLOWERS.—Flowers are the memories of childhood, which accompany us from the cradle to the grave. I left my birthplace at the age of seventeen, yet the peonies, tulips and roses of my mother's garden are pictured in my mind with a vernal freshness. Teach your children to love flowers, and they will love home and all its inmates. Beautify the grounds around your dwelling with rich foliage, plants and bright blossoms of sweet flowers, and the faces of all who look upon the scene will be lighted with smiles, while their hearts will worship the great Giver of all good and perfect gifts to man. If I could be the means of creating a general taste for gardening and love of flowers, I should feel as though I had been of more benefit to my country than all the military heroes of the present age. Worship God with flowers. As He loves all that is beautiful and good, so will He love you as you make your home lovely.

PREVENTING SEA-SICKNESS.—If you feel sickish, or know by experience that you will be sick, go to bed, close your eyes, and remain lying on your back, if possible, without motion; abstain from food, but not altogether; I would rather say, eat sparingly, and of solids, such as a little broiled meat, or biscuit, as I have known most alarming effects to arise from "total abstinence," to say nothing of the violent straining and fruitless retchings it occasions. Drink sparingly of cold water, or brandy and water in sips, but taste no hot liquid of any kind. In keeping the eyes shut, I would remark, that the effect of vision and its sympathy with the stomach are not enough attended to; for though at rest in the berth, the swinging backwards and forwards, and motion of the vessel and things around, are often sufficient to produce what we wish to avoid. There is, however, one point at which vomiting becomes inevitable, it is when the mouth fills with saliva, and then the sooner it takes place the better.—*Wilde's Narrative.*

PETROLEUM

ASPHALTUM and COAL

AGENCY.

WM. H. TOBEY & CO.,

San Francisco,

Having completed their arrangements with parties in the East, as well as those on this Coast, are now prepared to enter into the purchase, sale or lease of

PETROLEUM, ASPHALTUM AND COAL LANDS,

—ALSO—

COPPER, GOLD AND SILVER MINES,

LIBERAL advancements made on CRUDE PETROLEUM and COPPER ORES. We are also prepared to supply all BORING APPARATUS, TUBING, STEAM ENGINES, BARRELS for shipping Oil, etc., of the latest and most approved patterns.

Experienced Artesian Well Borers and help furnished at the shortest notice.

Persons at a distance wishing to send orders, receive information or subscribe for stock, will save time and money by communicating with us, as we are in constant communication with the most reliable houses and experienced persons at the East.

Parties owning Oil Lands or knowing where there are good prospects, will do well to write or meet us at our office. All communications strictly confidential.

We have now on our Books descriptions of Oil Lands which were selected by experienced chemists. Companies will be organized and incorporated under the laws of the State of California.

Samples from all PETROLEUM and COAL MINES on the Pacific Coast are solicited for our Laboratory.

Best of references given.

☞ *All business connected with Petroleum and Coal Mines* will be promptly attended to. Address

The Monthly Series of the MINING AND SCIENTIFIC PRESS comprises the Nos. of our weekly edition for each month bound in pamphlet style, forming monthly parts similar to those issued by the publishers of *Harper's Weekly*. They are very convenient for preservation and reference, and make a handsome work to send to your intelligent friends in distant mines, in the East, and in foreign countries. Price, 50 cents per copy, or $5.50 per annum.

U. S. 7-30 LOAN.

By authority of the Secretary of the Treasury, the undersigned has assumed the General Subscription Agency for the sale of United States Treasury Notes, bearing seven and three-tenths per cent. interest per annum, known as the

SEVEN-THIRTY LOAN.

These Notes are issued under date June 15th, 1865, and are payable three years from that time in currency, or are convertible, at the option of the holder, into

U. S. 5-20 Six Per Cent.

GOLD BEARING BONDS.

These Bonds are now worth a premium of nine per cent. including gold interest from November, which makes the actual profit on the 7-30 loan, at current rates, including interest, about ten per cent. per annum, besides its EXEMPTION FROM STATE AND MUNICIPAL TAXATION, WHICH ADDS FROM ONE TO THREE PER CENT. MORE, according to the rate levied on other property. The interest is payable in currency, semi-annually, by coupons attached to each note, which may be cut off and sold to any bank or banker.

The interest amounts to

One cent per day on a $50 note,
Two cents per day on a $100 note,
Ten cents per day on a $500 note,
Twenty cents per day on a $1,000 note,
One dollar per day on a $5,000 note.

Notes of all the denominations named will be promptly furnished upon receipt of subscription. This is

The only Loan in Market

now offered by the Government, and it is confidently expected that its superior advantages will make it

THE GREAT POPULAR LOAN OF THE PEOPLE.

Less than $300,000,000 of the loan authorized by the last Congress is now on the market.

This amount, at the rate at which it is being absorbed, will all be subscribed for within four months, when the notes will undoubtedly command a premium, as has uniformly been the case on closing the subscriptions to other Loans.

In order that citizens of every town and section of the country may be afforded facilities for taking the Loan, the National Bank, State Banks, and Private Bankers throughout the country have generally agreed to receive subscriptions at par. Subscribers will select their own agents, in whom they have confidence, and who only are to be responsible for the delivery of the notes for which they receive orders.

HELMBOLD'S

FLUID EXTRACT BUCHU

For Non-Retention or Incontinence of Urine, Inflammation or Ulceration of the Bladder or Kidneys, Diseases of the Prostrate Gland, Gravel, Brick Dust Deposits, Dropsical Swellings, Organic Weakness, Debility, Female Complaints, Etc.

H

HELMBOLD'S

FLUID EXTRACT BUCHU

—AND—

Improved Rose Wash

Will radically exterminate from the system Diseases arising from Habits of Dissipation, *at little expense, little or no change of diet, no inconvenience or exposure*; completely superseding those *unpleasant and dangerous remedies, Copaiba and Mercury*, in curing these diseases.

U

USE HELMBOLD'S

FLUID EXTRACT BUCHU

In all Diseases of the Urinary Organs, whether existing in MALE OR FEMALE, *from whatever cause originating, and no matter of how long standing*. It is pleasant in its taste and odor, IMMEDIATE in action, and more strengthening than any of the preparations of *Bark or Iron*.

Those suffering from *Broken Down or Delicate Constitutions, procure the Remedy at once.*

The reader must be aware that however slight may be the attack of the above diseases, it is certain to affect his *Bodily Health, Mental Powers and Happiness*. If no treatment is submitted to, Consumption or Insanity may ensue.

All the above diseases require the aid of a diuretic.

Hembold's Extract Buchu

IS THE GREAT DIURETIC.

L

HELMBOLD'S

DIGALY CONCENTRATED

Compound Fluid Extract Sarsaparilla,

For purifying the Blood, removing all diseases arising from excess and imprudence in life, chronic constitutional diseases arising from an impure state of the blood, and the only reliable and effectual known remedy for the cure of Scrofula, Scald Head, Salt Rheum, Pains and Swelling of the Bones, Ulcerations of the Throat and Legs, Blotches, Pimples on the Face, Tetter, Erysipelas, and all scaly eruptions of the skin, and beautifying the COMPLEXION.

M

NOT A FEW

Of the worst disorders that afflict mankind arise from the corruption that accumulates in the Blood. Of all the discoveries that have been made to purge it out, none can equal in effect HELMBOLD'S CONCENTRATED EXTRACT OF SARSAPARILLA. It cleanses and renovates the Blood, instills the vigor of health into the system, and purges out the humors which make disease. It stimulates the healthy functions of the body, and expels the disorders that grow and rankle in the Blood. Such a remedy, that could be relied on, has long been sought for, and now, for the first time, the public have one on which they can depend. Our space here does not admit of certificates to show its effects, but the trial of a single bottle will show to the sick that it has virtues surpassing anything they have ever taken.

B

Two tablespoonsful of the Extract of Sarsaparilla, added to a pint of water, is equal to the Lisbon Diet Drink, and one bottle is equal to a gallon of the Syrup of Sarsaparilla, or the decoction as usually made.

The above Extracts are prepared on purely scientific principles—in *Vacuo*—and embody the full strength of the ingredients entering into their composition. A ready and conclusive test will be a comparison of their properties with those set forth in the U. S. Dispensatory.

O

HOW TO USE THE REMEDIES.

In Diseases of the Blood, Humors on the Face, or any and every part of the body, use Extract of Sarsaparilla, applying to Pimples and all external Humors or Eruptions the Improved Rose Wash.

Use the Extract Buchu for all diseases requiring the aid of a diuretic, except those of the Urinary Organs, such as Gonorrhœa and Gleet; in these use the Extract Buchu, and inject with the Improved Rose Wash.

L

☞ THESE EXTRACTS HAVE BEEN ADMITTED TO USE IN THE UNITED STATES ARMY, and also are in very general use in all the STATE HOSPITALS AND PUBLIC INSTITUTIONS throughout the land, as well as in private practice, and are considered as invaluable remedies.

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

BALDNESS

Can be Cured!

MR. M. HOWARD, from Virginia City, Nevada, has discovered and patented an ENTIRELY ORIGINAL ARTICLE for producing a fresh, vigorous and permanent growth of the Hair upon the human scalp, where total or partial baldness has prevailed. His remedy is the assistant of Nature itself, enabling the Hair to penetrate the scalp and sustain its growth. It is simple and harmless in its application, but powerful in its good results, reproducing hair upon bald heads of long standing and preventing the hair from falling out. Mr. Howard will show interested parties calling upon him, at his room, No. 15, second floor, n 522 Montgomery street, San Francisco, a long list of affidavits, containing positive recommendations of his RESTORATIVE from prominent residents of Virginia City who have been benefitted by its application. 17v10

New Mining Invention.—Mr. R. H. Danning, of North San Juan, Nevada county, well known to the mining community as the inventor of an important device for saving gold in placer mining, has now added another improvement to be attached to his under-current riffle box, a model of which was submitted to our inspection on Thursday last. The improvement consists in removing one of the pieces forming the false bottom of the riffle box, near the end, and making a small reservoir of the vacant space, which is covered with a sieve or screen, to keep out the coarse gravel while the water and fine dirt or sand pass through. A vertical pipe carries it from the reservoir into a barrel or box beneath, discharging it below the surface of the water and near the bottom of the vessel, which may be a barrel or box of any convenient shape. The heavy sand and gold remain on the bottom, while the light dirt is carried with the water over the brim of the vessel. The water and dirt in the same are kept in continual agitation by the discharge of the pipe, so that the light sand is constantly stirred and carried away. The vessel may be cleaned up as often as is thought proper. The invention is a simple one, and we do not see why it should not work well.

Concluded.—We conclude, with the present issue the demonstration of the Tractory Curve, and the discussion of the grinding effects of differently formed plates. These calculations possess a scientific interest of no small moment, and have attracted considerable attention from various quarters. Professor Silliman, to whom they were submitted, in writing to Mr. Randall, the author of the calculation, says :—

"Your mathematical demonstration of the mechanical properties of this curve is, so far as I am informed, original and very interesting, and satisfies perfectly the practical requirements of the problem. The Tractory Conoid is a solid the nature of whose eure is as different from that of the surface of a cone as is a cycloid from an inclined plane.

"Your mathematical analysis of the problem of uniform grinding, by tractoroidal surfaces, is extremely interesting, and furnishes a fine illustration of the value of this method of discussion applied to a case which at first sight would seem to be completely beyond the reach of such subtile and exact tests. The practical value of this discussion and of the results which it appears to sustain, are such as commend it to the serious attention of all who are interested in the development of the resources of the Pacific coast in the precious metals."

Heaviest Shipment Yet.—On the 2d inst., Wells, Fargo & Co. received at Virginia City, for shipment to San Francisco, sixty-one bars of bullion, worth as per assay, $115,643.33, being the heaviest consignment yet at any one time.

Progress of Science.

Want of space, last week, prevented us from alluding to the interesting remarks of Dr. C. T. Jackson, at the recent meeting of the California *Alumni* at Oakland. We now give the following abstract of the Doctor's speech on that occasion, especially reported for the Mining and Scientific Press. The Doctor was playfully introduced to the audience as a speaker who had put more men to sleep than any other man on the continent—through his famous discovery of the anæsthetic properties of ether. He said :—

Mr. President, Ladies and Gentlemen :—Introduced in so flattering a manner to this company, I hardly know what I can say to meet your and their expectations, and if I should chance to put you all to sleep, you will perhaps attribute the effect to the all-pervading ether.

Called up to respond to a sentiment recognizing the influence of science in the arts, and above all, in the arts of mining and metallurgy, which I have had for many years the privilege and the pleasure of ministering to, it may be justly expected that I should say a few words concerning the mining interests of California; but as I have been here for a very short time only, and as most of my labors, thus far, have been spent in the silver regions of the adjoining State of Nevada, and only a few of your quartz mines in Amador and Grass Valley have been examined by me, I shall therefore make a few remarks on the general subject of the application of science to useful purposes and endeavor to impress you with the fact that science is a great power in the arts, and that its predictions anticipate future realizations.

When Sir Humphrey Davy first discovered between the poles of his voltaic battery some small globules of brilliant metals extracted from potash and from soda and proved those alkalies to be nothing but oxyds of the metals potassium and sodium, he was able to look far beyond what he had actually discovered and to predict that all the alkaline earths would also prove to be the oxyds of metals—that lime, magnesia, alumina, baryta, strontia, lithia and every one of the earthy bodies would, when reduced to their elementary constituents, be found to consist of peculiar metals united with oxygen. Here was a magnificent generalization, which has been since verified in every particular; and metals that Davy never saw, except in his minds eye, are now in the hands of all chemists.

The properties of some of these new metals have already become known and their useful applications realized. This you see in the beautiful alloys of aluminium with copper, which resembles gold in beauty and in high malleability and ductility, and in the alloy of aluminium with silver, which is far superior to the alloy of silver and copper in hardness, whiteness and in resistance to sulphur in tarnishing. The alloys of aluminium and zinc are also very beautiful and will be very valuable. The wootz steel of India is also found to be an alloy of iron with aluminium.

How much further the study of aluminium alloys will go we are not yet aware; but I have no doubt that other valuable results are still to be reached. Magnesium, which can now be produced in the form of wire at a cost of a penny a foot, has taken the place of sunlight before the camera obscura and photographic plates, and enables us to take pictures in the night time, and in the dark interiors of the pyramids, throwing light on the sculptured record of bygone ages. This newly brought out metal predicted by Davy, when a wire of it is simply set on fire, gives out a bright light as dazzling as the full glare of the sun and possessing all the chemical properties of sunlight, which you know ordinary artificial light does not.

It is ascertained that *one ounce* of magnesium when burnt gives out as much light as is produced by *twenty-eight pounds* of stearine candles; and it has been proposed to manufacture the metal on a large scale, and to furnish it for domestic illumination, and also for light-houses.

These examples must suffice for the present, as we have not time to indulge in any reflections upon the future applications of the other metals alluded to; suffice it to say that only a beginning has been made in the study of their practical uses, and that much is still in store for us.

Not many years ago certain dark colored lines were noticed in the image of the solar spectrum; but who then imagined that those lines recorded what was burning in the sun, millions of miles away from this earth? Bunsen and other ingenious chemists, by experiments on the ignition and combustion of metals in a blue gas flame, found when the rays of light were analyzed by the prism that record was made as to the nature of the burning body by certain well known marked lines in the spectrum image. They soon were enabled to tell us what bodies were burning on the surface of the sun, and at this time are also analyzing the combustion going on in the fixed stars!

By the spectroscope four new metals have been discovered within the last four years namely, cæsium, rubidium, thallium and indium, which though at first found in infinitesimal quantities, have since been discovered in certain minerals in sufficient abundance for chemical study, and perhaps for future application in the arts and in medicine. Who will dare to say that these things are of no use?

When Franklin was asked, "what is the use of electricity?" he replied by asking in return, "what is the use of a baby?"

Had Franklin lived to this day he would have seen his baby electricity grown to be a strong man, stretching his giant arms across this continent and almost around the world, and tossing messages from one hand to the other with a legerdemain to the uninitiated, quite incomprensible, and doing his work in far less than no time.

He would have found his grown up baby amusing himself with electrotyping wood cuts, copper plates, printing types, copying statues, bas-reliefs, coins, engravings, and many rare works of art, and now and then essaying his strength (as yet, however, rather unprofitably) against the steam engine, both on the water and on the railroad. We are just beginning to discover what Franklin's grown up baby can do, and it will not be safe for us to endeavor to limit his powers.

Scientific men, and not mere patentees of their inventions and discoveries, have given to the world these wonderful results.

Mining, too, is dependent upon the sciences of mineralogy and geology, which give information as to the associations of minerals and their situation in the earth's rocky crust, so as to enable us to predict their occurrence with almost as much certainty as Le Verrier indicated the place of the new planet Neptune by the perturbations of Uranus. Valuable minerals have been seen and not discovered until the associated minerals indicating them first gave notice of their presence. The geologist Murchison, in his study, pointed out the gold of Australia before a particle of the metal had ever been seen by the miners, and the emery of Massachusetts was discovered by its associated minerals indicating it, though it had been seen and handled but never recognized before.

The discovery of the native copper mines of Lake Superior was made by a geologist after a large party of miners had searched the country for it and found nothing. These records should be made, for practical miners are too apt to overlook the services of their scientific friends. Tin ores have always certain accompanying or associated minerals which were produced by the same chemical causes that brought up the oxyd of tin, and hence he who knows those minerals and the theory of their origin is most likely to discover a tin vein. The same laws will be found to prevail in many cases, and when a true theory of the origin of all metalliferous veins shall be discovered, there can be no doubt as to its immediate and useful practical application by intelligent and educated miners.

California, in addition to her mineral wealth, owes to herself and to her children the cultivation of letters and of the sciences. That you are not merely temporary sojourners on the Pacific shores, but permanent residents, intending to make this country your home and the home of your children, is evidenced by your permanent cities, and above all by the founding of colleges and universities of learning and academies of science, where your children can be fully educated in all departments of human knowledge.

Scientific Investigation.—Dr. C. T. Jackson, the eminent mineralogist, and Dr. John Terry, a distinguished botanist, and Director-in-Chief of the United States Assay Office at New York, are about to proceed to Santa Barbara, with the view of making a scientific investigation into the phenomena connected with the oil and asphaltam deposits in that county. Their attention will also be directed to the remarkable appearance of oil upon the surface of the sea in that vicinity. We understand that application has been made, by telegraph to Washington, for the use of the revenue cutter Shubrick to carry these gentlemen to their point of destination, and for such other service as may be needed in aiding their investigations upon the neighboring islands and upon the adjacent waters of the ocean. Whether the special favor asked for is granted or not, private enterprise, if needed, will furnish these gentlemen with whatever assistance they may need in the pursuit of the interesting enquiry which they have in view. Should the information gained be at private expense, however, it may be presumed it will be held for individual advantage; hence it is to be hoped that the object of their visit will be considered by the Department at Washington of sufficient public and scientific interest to warrant the placing of the Shubrick at their disposal. At all events, the public may look for something of value and interest from them on their return. It may perhaps be proper for us to state, in this connection, that either of these gentlemen, during their stay on this coast, which will be short, will be happy to place their services at the disposal of any parties who may desire to have their mines or oil locations examined and reported upon by competent and reliable experts. Whoever may see fit to employ them may rely, most implicitly, upon their judgment and probity.

To Correspondents.—"Sheba, Star Canoa, Humboldt County, Nevada;" and a "Letter from Alcatraz Island" have been received and will receive attention next week; as will also a neatly bound volume, "prepared by Capt. John Mullan," and entitled "Miners' and Travelers' Guide to the Northwestern Territories."

Interest Table.—W. Holt, map dealer, No. 305 Montgomery street, has just issued a convenient interest table.

[From the Quartz Operator's Hand Book, by Wheeler & Randal—in press.]

DISCUSSION OF THE TRACTORY AND DIFFERENTLY FORMED GRINDING PLATES.

[Concluded from page 322.]

4_7. Substituting value of x^2 of Eq. 3_7 in Eq. 2_7

$$z^2 = \left(\frac{h^2}{a^2} + 1\right) y^2$$

5_7. Extracting square root of Eq. 4_7

$$z = \sqrt{\left(\frac{h^2}{a^2} + 1\right)}\, y$$

6_7. Surface of cone whose slant height is z

$$S = \pi \sqrt{\left(\frac{h^2}{a^2} + 1\right)}\, y^2$$

7_7. Differentiating Eq. 6_{10} $ds = 2\pi \sqrt{\left(\frac{h^2}{a_2} + 1\right)} y\, dy$

When the tendency to wear at A is P, it is evident that the tendency to wear at P is $\frac{P}{a} y$, parallel with the axis.

8_7. Hence differential of effect

$$\frac{2\pi P y^2}{a} ds = \frac{4\pi^2 P}{a} \sqrt{\left(\frac{h^2}{a^2} + 1\right)} y^2\, dy$$

9_7. Integrating Eq. 8_7 $\int \frac{2\pi P y^2}{a} ds = \frac{\pi^2 P}{a} \left(\frac{h^2}{a^2} + 1\right) y^4$

10_7. By making $y = a$ in Eq. 9_7.

$$\text{Grinding effect} = \pi^2 P \sqrt{\left(\frac{h^2}{a^2} + 1\right)} a^3$$

11_7. By making $h = \frac{a}{2}$ in Eq. 10_7.

$$\text{Grinding effect} = \frac{\pi^2 P a^3}{2} \sqrt{5}$$

12_7. Removing surd sign from 2d member of Eq. 11_7. Grinding effect $= 1.118\, \pi^2 P a^3$

Comparison.—Let a comparison now be instituted between the grinding effects of *plane circular plates*, increasing in hardness from the center to the circumference in the ratio of the increase of the radius, plane circular plates of uniform hardness, "Randall's Patent Grinding Plates," conical plates of uniform hardness, and tractory conoidal plates, and all of the usual ring, form, same diameter, same weight, and running at the same velocity.

1st. Plane circular plates, increasing in hardness from the center to the circumference in the ratio of the increase of the diameter.

Making y less than a. For example, $y = \frac{a}{3}$, and substituting this value for y in Eq. 3_5, and we have

1_8. Grinding effect (the radius being $\frac{a}{3}$) $= \frac{4}{27} \pi^2 P a^3$

2_8. Subtracting Eq. 1_8 from Eq. 4_5.

$$\text{Grinding effect (ring)} = \frac{32}{27} \pi^2 P a^3$$

3_8. Or expressing decimally.

$$\text{Grinding effect (ring)} = 1{,}1852\, \pi^2 P a^3$$

2d. *Plane Circular Plates* of uniform hardness.

Making y less than a. For example, $y = \frac{a}{3}$, and substituting this value for y in Eq. 4_6, and we have

1_9. grinding effect (radius being $\frac{a}{3}$) $= \frac{\pi^2 P a^3}{81}$

2_9. Subtracting Eq. 1_9 from Eq. 5_8,

$$\text{Grinding effect (ring)} = \frac{80\, \pi^2 P a^3}{81}$$

3_9. Or expressing decimally.

$$\text{Grinding effect (ring)} = ,9877\, \pi^2 P a^3$$

3d. *Randall's Patent Grinding Plates.*—These plates consist of two or more concentric rings of different hardness. The softer plates are arranged nearer the center where there is the less wear, and the harder plates more remote where the wear is greater. This arrangement remedies in a great measure the otherwise fatal defects of plane circular and conical plates.

For Example.—Let a = the greater radius of the plates.

Let $\frac{a}{3}$ = the radius of the opening.

Let $\frac{2a}{3}$ the greater radius of the inner ring.

1st. Making $y = \frac{a}{3}$, and substituting this value for y in Eq. 4_6, and we have

1_{10}. Grinding effect $\left(\text{radius } \frac{a}{3}\right) = \frac{\pi^2 P a^3}{81}$

2d. Making $y = \frac{2a}{3}$, and substituting this value for y in Eq. 4_6, and we have

2_{10}. Grinding effect $\left(\text{radius } \frac{2a}{3}\right) = \frac{16\pi^2 P a^3}{81}$

3_{10}. Subtracting Eq. 1_{10} from Eq. 5_6;

$$\text{Grinding effect (ring)} = \frac{80}{81} \pi^2 P a^3$$

4_{10}. Subtracting Eq. 2_{10} from Eq. 5_6

$$\text{Grinding effect (ring)} = \frac{65}{81} \pi^2 P a^3$$

5_{10}. Comparative weight of the outer ring,

$$= a^2 - \frac{4a^2}{9} = \frac{5a^2}{9}$$

6_{10}. Comparative weight of entire plane, less the opening,

$$= a^2 - \frac{a^2}{9} = \frac{8a^2}{9}$$

7_{10}. Then $\frac{5a^2}{9} : \frac{8a^2}{9} :: \frac{65\pi^2 P a^3}{81} : \frac{104\pi^2 P a^3}{81}$

8_{10}. Or grinding effect of outer ring, $= \frac{104}{81} \pi^2 P a^3$

9_{10}. The loss sustained by plates of uniform hardness,

$$= \frac{104}{81} \pi^2 P a^3 - \frac{80}{81} \pi^2 P a^3 = \frac{24}{81} \pi^2 P a^3$$

Let it now be assumed that the inner plates or rings are one-third as hard as the outer plates.

10_{10}. See Eq. 9_{10}. Loss sustained,

$$= \frac{24}{81} \pi^2 P a^3 \div 3 = \frac{8\pi^2 P a^3}{81}$$

Subtracting Eq. 10_{10} from Eq. 8_{10}, gives for "*Randall's Patent Grinding Plates*, viz.:

$$\text{Grinding effect} = \frac{96\pi^2 P a^3}{81}$$

12_{10}. Expressing decimally;

$$\text{Grinding effect} = 1.1852\pi^2 P a^3.$$

Subtracting Eq. 2_9 from Eq. 11_{10}, and dividing the remainder by Eq. 2_9, gives the per centage of "Randall's Patent Grinding Plates," both over plane circular, and conical plates of uniform hardness, as follows:

13_{10}. Per centage in favor of "Randall's Patent Grinding Plates," $\left(\frac{96\pi^2 P a^3}{81} - \frac{80\pi^2 P a^3}{81}\right) \div \frac{81}{80\pi^2 P a^3} = ,20$

4th. *Conical Plates* of uniform hardness and of ring form.

1_{11}. Making y less than a, for example $y = \frac{a}{3}$, and substituting this value for y in Eq. 9_7, and we have the grinding effect $\left(\text{the radius } \frac{a}{3}\right) = \frac{\pi^2 P a^3}{81} \sqrt{\left(\frac{h^2}{a^2} + 1\right)}$

2_{11}. Subtractiug Eq. 1_{11} from Eq. 10_7.

$$\text{Grinding effect (ring)} = \frac{80\pi^2 P a^3}{81} \sqrt{\left(\frac{h^2}{a^2} + 1\right)}$$

3_{11}. Making $h = \frac{a}{2}$ in Eq. 2_{11}.

$$\text{Grinding effect (ring)} = \frac{80}{81} \pi^2 P a^3 \sqrt{\left(\frac{5}{4}\right)}$$

4_{11} Expressing decimally.

$$\text{Grinding effect (ring)} = 1{,}1042\, \pi^2 P a^3$$

5th. *Tractory Conoidal Plates* of uniform hardness.

Making y less than a. For example $y = \frac{2a}{5}$ as is the case in the Wheeler & Randall muller or grinding plates.

1_{13}. Substituting $\frac{2a}{5}$ for y in Eq. 5_4.

$$\text{Ring effect} = \frac{32\, \pi^2 P a^3}{25}$$

2_{12}. Making the tractory conoidal plate of the same weight or solidity as the plane circular or conical plates, and Eq. 1_{13} becomes Grinding effect (ring) $= \frac{16}{9} \pi^2 P a^3$

3_{12}. Expressing decimally.

$$\text{Grinding effect} = 1{,}7778\, \pi^2 P a^3$$

Recapitulation.—To express the relative grinding effects of the differently formed plates now considered, the literal factors $\pi^2 P a^3$, common to all their formulas, may be omitted.

Omitting the literal factors, and the relative grinding effects of differently formed plates become as follows, to wit:

1_{13}. Eq. 3_9.—Plane circular plates of uniform hardness = ,9877.

2_{13}. Eq. 12_{10}.—Randall's Patent Grinding Plates = 1,1752.

3_{13}. Eq. 4_{11}.—Conical plates of uniform hardness = 1,1042.

4_{13}. Eq. 3_{12}.—Tractory conoidal plates of uniform hardness = 1,7778.

Hence the conclusion that *tractory conoidal plates* not only differ materially in form from *plane circular* and from *conical plates*, but also differ essentially from, and are greatly superior to them in their grinding properties.

The Problem of Gold and Silver Extraction—A General Review—No. XI.

BY PROF. L. LANZWERT.

CALCINATION AND ROASTING.

These processes are more frequently made use of than any other operation had recourse to by the practical metallurgist, for effecting the elimination of sulphur and other volatile substances from the ores which are sulphides or sulphurets. No agency is so commonly employed as this, although the mention of a few others should not be omitted; amongst these may be enumerated the combined application of heat and aqueous vapor; of heat and the decomposing agent of a metallic oxyd; finally, of heat and the decomposing agency of alkalies, alkaline earths and their combinations. As a general rule, however, we may regard all other metallurgic processes, having reference to the decomposition of sulphurets, rather as preliminary *assay* operations, than the final processes capable of adoption by the manufacturer. The process of calcination is generally adopted to remove volatile substances. Iron and zinc ores are heated to expel water from them; and iron, lead and zinc are calcined to expel carbonic acid. Water will escape by the application of a gentle heat; but if much clay be present with the ore, it adheres tenaciously to the mineral. Calcination is most conveniently performed in a crucible, because no stirring of the mass is required. The heat of an air furnace is generally sufficient for the performance of this operation.

The operation of roasting is performed by various processes, depending on the nature of the ore, the quantity of the fuel and the object in view. Roasting in heaps, in the open air, is the method most generally adopted with iron ore, pyrites, and ore which can bear a strong fire. The operation consists in spreading over a plain surface of ground, billets of wood, or lumps of mineral coal, from six to eight inches thick, the interstices between the coarse fuel being filled up with chips of wood, charcoal, coke or coal. Over the fuel thus prepared, according to the kind of ore, is spread a layer of from twelve to twenty-four inches in thickness of ore. Coarse ore, which will bear a great heat, may be piled pretty high, but fine crushed ore from the stamps, and ores which smelt easily, such as sulphurets or arseniurets, should not have too much coal in a body, nor the ore piled over high.

Alternate beds of fuel and ore are thus formed, and roasting heaps accumulated, which are in many cases extremely large, retaining the fire for a long time.

Roasting means heating a substance to such a point that the mineral does not melt, but at which the volatile substances are expelled, and as much oxygen combined with the ore as it can absorb. In some case chlorine, carbonic acid or steam is required along with the air; in other instances the object is to oxydize the ore to a higher degree, to drive off volatile matter, or to reduce the ore to metal and evaporate it, as in the case of arsenic, zinc and antimony.

The tendency of carbon to unite with metals is slight and circumscribed; only two metals, considered in a metallurgic sense, are amenable to this kind of combination—copper and iron. Nevertheless, they are the most important of all metals; and without the carburets of iron (cast iron and steel), the most important forms in which iron is now employed, could never have been brought into use. The union of carbon with copper is only productive of inconvenience, and the care of the metallurgist is devoted to effect the removal of the former; but in the case of iron, though on one hand the removal of carbon is a metallurgic process highly desirable, in order that soft wrought iron may result; nevertheless, on the other hand, the problem of causing the union of soft iron with carbon is one of importance, equally great, for on its successful issue depends the conversion of iron into steel. Though the great magazine of phosphorus in creation is the bones and some of the fluids of animals, nevertheless, phosphoric acid, combined with oxyds of metals, and constituting phosphates of those oxyds, give rise to a small though important group.

Perhaps no element wherewith metals are naturally found in combination is more difficult to separate effectually, or exerts a more deteriorative influence, when present, even in minute quantities, than phosphorus. The processes usually had recourse to by the metallurgist for effecting the separation of phosphorus, are based upon the employment of some body which manifests a strong affinity for phosphorus at elevated temperatures. Of this kind is chalk, which is sometimes employed for the purpose of separating phosphorus from iron.

Occasionally, though not very often, the metallurgist has to deal with the extraction of metals from their salts, both oxygenous and haloid. This kind of extraction, too, involves not merely the dry process, but also the use of chlorine and of acids. Platinum is a metal which has to be dealt with exclusively by the process of moist solution. Limiting our observations for the present to the case of dry operations, we find that certain metallic salts are decomposable by heat alone, whilst others require the agency of some collateral reducing body. Most of the salts of the metals, gold, platinum and silver, are characterized by their facility of complete decomposition by the mere application of heat. Of this change, the chlorides of gold, silver, platinum and the sulphate of the oxyd of silver present familiar examples. Many other metallic salts, when subjected to the agency of heat, instead of being reduced to their metallic form, yield their several oxyds. The sulphate of iron and the sulphate of copper are of this class, yielding, when sufficiently heated, oxyds of their respective metals.

To the practical metallurgist, the most interesting series of saline decomposition by fire, and deoxydizing materials, are those in which the sulphates of different metals are concerned. Sulphates differ merely from sulphides (viewed as to their composition) in the mere circumstance that the former contain oxygen, whilst the latter do not; hence, when the sulphates are heated in contact with coal, coke, or other deoxydizing matter, oxygen is frequently removed and a sulphide remains. The relative facility of this kind of decomposition varies for different sulphates, but it furnishes a type of most of the decompositions which ensue when the sulphates are exposed to the combined agency of deoxydizing materials and heat.

Of all the salts which come under metallurgic cognizance, the chlorides, next to the sulphates, are most important. The reduction of the chloride of silver from the basis of the mode of silver extraction in various parts of the world, the reducing agent being iron. Various other methods of reducing chlorides to the metallic state are followed in the processes of metallic assaying; and, although not much involved in the practice of metallurgy on the large scale, are still of great importance to the metallurgist. The reduction of chloride of silver by heating with alkalies, of the chlorides of certain metals by the contact of another metal, and of the chlorides of gold and platinum by sulphurous, oxalic, arsenious and formic acids, sulphate of iron, and a few other reagents, are familiar examples.

[To be continued.]

(Written for the Mining and Scientific Press.)

THE GEYSER SPRINGS OF CALIFORNIA.

In April, 1854, some enterprising gentlemen residing in San Francisco, charmed with the wild scenery and the natural wonders of the place, took possession of the Geyser domain and located school land warrants thereon, after a survey made in accordance with the laws of the State. It was, in company with one of these gentlemen, in the fall of 1859, that Bayard Taylor made the acquaintance of Captain Davidson, who was engaged at the time in the prosecution of a trigonometrical survey of the coast region for the Government. Captain Davidson narrates as follows:—

"To go back a few miles into our last letter—we may give intending tourists a few items of interest on the road. Healdsburg is 175 feet above the ocean; Ray's station, 617 feet; the first ridge above Ray's, 2,268 feet, where you pass between the heavy oak gate posts; the crossing at Sulphur creek, 1,706 feet, and the last plateau, from which directly rises the crest of Sulphur Peak, 2,460. The peak itself is 3,471 feet, by late trigonometrical determinations. Now we may continue our journey, not fearing to climb the Peak, to have one long, last look at the varied landscape. Far to the south, you can see Petaluma on a clear day; the South Farralone, seventy-two miles distant; Punta de los Reyes, and the blue line of ocean horizon. The highest part of the ridge forming the north spur of Sulphur Peak, is 3,118 feet high; thence you descend and cross the ridge forming the north spur of the Peak; it is 3,118 feet high. Now along the Hog's Back, falling to 2,761 feet just beyond the gate. From this sharp ridge the view is fine. Far to the southeastward lies Napa Valley, in enchanting loveliness; at your feet, deep gorge and ravine, covered with chaparral or dotted with the not often seen 'sear and yellow leaf.' After quitting this backbone, you rise to 3,180 feet—the greatest elevation on the road; keep to the northwestward, on a crooked but almost level road about three-quarters of a mile, and at the commencement of the descent you are elevated 3,092 feet; thence you wind down the steep road to Pluton Canon. Long before you reach it, the sulphurous-laden air, the roar and steam of the 'steamboat Geyser' meet your organs of sense. If you recollect your early Isthmus experience, give your animal the rein and trust to his knowledge more than your own. Lose none of the varied and changing scenery on every hand. If you be the proverbial 'early bird,' the sun will warm you through the eastern gorges of the canon, and cast a kaleidoscope light and shadow to delight and charm the unpainting artist, not *blase* with Alpine scenery. Many a spot will you see where a cozy cottage would afford a month's summer retreat from the rheumatic fogs of San Francisco; but recollect we have already chosen the best, to our taste, and trust that yours will not conflict with it.

"The floor of the hotel we found to be 1,692 feet high—we mean above the ocean. It is beautifully situated immediately opposite the Geysers, where the steam at early dawn rises over two hundred and fifty feet, even at this dry season. We were more than pleasantly disappointed at the wonder of the place, and after breakfast determined to enter upon our explorations.

"Descending from the hotel about seventy-five feet, we first meet the 'spring of iron, sulphur and soda,' having a temperature of 73° Fahr., and pleasant to the taste. We crossed the Pluton, ninety-seven feet below the hotel—we like to be particular about the odd feet, always stick to the fractions, and, if they be not vulgar, you will carry conviction—running between and among huge metamorphic boulders, incrusted with sulphurous deposits. The temperature of the stream was 79°.5. The first spring going up the Geyser gulch is the 'tepid alum and iron incrusted,' having a temperature of 97°.5, and with a very heavy iridiscent incrustation of iron, which forms in a single night, as we have tried by experiment. Of all the springs, this is the most powerful, and you will gladly take a second drink of its tonic waters. Twenty feet from this we pass the 'Medicated Geyser bath,' having a temperature of 88°.8, and containing ammonia, epsom salts, magnesia, sulphur, iron, and goodness knows what else. Going upward, we come to a cool, shady retreat, called Prosepine's Grotto, from whose sides we collected crystals of epsom salts two inches in length, and fine as floss silk.

"From this point epsom salts begin to predominate. Higher up, the 'spring of boiling alum and sulphur' has a temperature of 156°, but where it issues, is at the boiling point; so, also, is the 'black sulphur,' quite near it. The 'epsom salt spring,' combined with a little iron, has a temperature of 146°, and within six feet of it is a 'spring of iron, sulphur and salts,' at the boiling point. Soon we come upon the 'boiling black sulphur' spring, roaring and tearing continually; the noise is so peculiarly like that of a half-submerged propeller that it has received that name.

"As we wander up over rock, heated ground, and thick deposits of sulphur, salts, ammonia, tartaric acid, magnesia, &c., we try our thermometer in the Geyser stream, a combination of every kind of medicated water with the cold, clear spring of water at the source, and find it runs up to 122°. In many places, if you step out of the regular trail, the crust of the earth sinks under you; hissing steam and heated air assail you, and the thermometer thrust in the crevices runs over 180° as you draw back from the scalding vapors. All this time the roar of the steamboat Geyser and its great volumns of steam warn you that you are approaching the focus of action and treading on the face of one of nature's vast laboratories, whilst a horrid boiling and seething as the black cavernous opening on the left of the stream tells of another operation unceasingly going on. We have reached the famous Witches' Cauldron, over seven feet in diameter, partly eaten out of the side of the crumbling cliff, of unknown depth and of great activity. The contents are thrown up about two or three feet high in a state of great ebullition, and made ten times more horrid by being only semi liquid, blacker than ink, and contracted with the volumes of vapor arising from it. The point of greatest activity is on the farther side, and the temperature 195°.5.

"The water itself is insipid, and the deposit when dried is a very fine, light, lead colored sandy earth. It is about eighty-three feet higher than the hotel. Opposite this spring is a boiling alum spring, very strongly impregnated. The temperature of the exposed water is 176°. Within twelve feet of this is an intermittent scalding spring, from whose irregular black opening issue steams and jets of boiling water; we have seen them ejected over fifteen feet—so keep your eye open when you see them coming! The peculiar noise and action of this spring have led it to be called the Devil's Grist Mill—truly, we believe we are on the borders of the infernal regions, and all our thoughts conjure up the classic mythology concerning the shadowy world. But the crowning glory of it all is the steamboat Geyser, having the well known and peculiar way of a high-pressure seven-boiler boat blowing off steam, which issues in a column about two feet in diameter, and so heated as to be invisible until it is six feet from the mouth. This famous sight can only be approached when a strong wind is blowing the steam away from you—to be enveloped in it would be to forbid you in less time than you read this sentence.

"Upon the first day of our arrival we could not approach it, but subsequently stood within six feet of its horrid, burning mouth. Just above this, the gulch divides; up the left, or western one, are many hot springs, but the 'Scalding Steam Iron Bath' is the most important; the water from it we found to have a temperature of 183°. On the spur between this and the right, or eastern gulch, and 150 feet above all apparent action, we found a smooth, tenacious, plastic, beautiful blue clay, having a temperature of 167°. From this point you stand and overlook the ceaseless action, the war, steam, groan and bubbling of a hundred boiling medicated springs, whilst the steam ascends an hundred feet above them all. It is up the eastern gulch that you find the source of the Geyser stream, that unites and carries down with it all the waters of this natural laboratory. At the head, we found pure, limpid water, having a temperature of 71°(the sun shining upon it), whilst alongside of it, and commingling its waters, is an iron spring, having a temperature of 71°5.

"Following the usually traveled path, we pass over the 'Mountain of Fire,' with its hundred orifices beautiful with their steam jets at sunrise, thence through the 'Alkali Lake,' having a very crater-like form, and over which your inexperience prompts you to tread carefully. Stop a moment and stamp upon the firmest looking portion, and a deep subterranean growl tells of the hollowness beneath, thence we pass to the inappropriately and inelegantly designated 'washtaly' cauldrons of black sulphurous boiling waters, some moving and sputtering with violent ebullition, some boiling noiselessly, some with constant and powerful escape of steam, and some with the deep rumbling of cavernous ebullition. One white sulphur spring we found quite clear, and up to the boiling point. At this place we found a cream-colored, warm plastic clay, but filled with fine grit.

"Tramping back to the hotel, foot-sore, and driven in perspiration, we took a warm, white sulphur bath, at the bath-house. This water is led by pipes across the Pluton from the boiling sulphur springs in the steep bank opposite. They are a fine sight in the early morning. Rather foolishly we took the warmest bath—temperature 116°.5—and in half an hour came out like a well boiled craw-fish. The red sulphur baths had a temperature of 106°; one that had stood over night was 104°. With cool water you can suit the temperature by your feeling, except to get the freezing point, as ice is rather scarce.

"On every foot of ground we had trodden, the crystallized products of this unceasing chemical action abounded—alum, magnesia, tartaric acid, epsom salts, ammonia, nitre, iron, sulphur, etc. We tasted of everything, and our tongue, lips and throat paid the penalty of the rashness. At thousands of orifices you find hot scalding steam escaping and forming beautiful deposits of arrowy sulphur crystals, some nearly two inches in length. Make a hole in the burning ground, and subsequent visits show you that this process has commenced around it. Forget for a moment your burned boots, tired limbs, and steamed clothes, and follow the train of thoughts that that this great and changing action suggests. How great and how small is this peripatetic, microcosm man?

[To be Continued.]

COMING PROMOTIONS.—General Grant has ordered the several Corps Commanders to recommend a certain number of meritorious officers of their commands for promotion in the regular army.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

SAN FRANCISCO, SATURDAY MORNING, June 17, 1865.

The money market is substantially unchanged, with, however, a tendency to lower rates of interest. Capital is thought to be more abundant than for some time past, and during the last 30 days transfers from abroad have added at least $600,000 to our available means.

Receipts of treasure from the interior since Saturday last amounted to $1,300,000, making an aggregate of $2,800,000 during the current month. Gold bars are selling at 830@840, and silver is quotable at ½ ℔ cent. premium to 2 ℔ cent. discount.

Legal Tender Notes have been in less request this week, declining from 76¾ to 72¼, and closing at 73⅛ bid, 73¼ asked. Subscriptions to the seven-thirty loan, under the auspices of Wells, Fargo & Co., have absorbed some $650,000 since the 25th of May. Latest telegraphic advices from the East quote gold at about 138½.

A much better feeling has pervaded the share market this week, and nearly all prominent stocks were actively dealt in at enhanced rates. A few low-priced shares have also been buoyant at higher prices. An impression seems to prevail among some dealers that a turning point has been reached, and that the market will continue to improve. The fears entertained a short time since respecting most of the Comstock claims have given place to different views, and it is believed by many that recent developments in Gold Hill have not only set at rest these apprehensions, but have disclosed a certain degree of wealth not calculated upon at any former period. A number of dealers, who are usually well informed, maintain that the present condition of some o these mines never was so promising, and that current quotations at the Board do not fairly represent their real value. They contend that the apparent deterioration of a portion of the Comstock lode should not unfavorably influence claims known to possess intrinsic merit, and giving every appearance of future permanency. But the losses sustained a few weeks since, by nearly all classes, should not be lost sight of or forgotten, however causeless may have been the panic which immediately followed, and which in some degree still exerts a demoralizing influence over the whole market. A restoration of confidence must and will ensue if the better class of mines are enabled to pay regular dividends to stockholders, and an honest and economical administration of their affairs is adhered to.

Gould & Curry opened on Saturday last at $1,575, seller 30, rose to $1,650, receded to $1,625, rallied again to $1,650, and closed at $1,630 bid. The resignation of Superintendent Bonner takes effect on the 1st July, and his successor, Mr. Janin, will then take charge of the company's affairs in Nevada, whose compensation is not to exceed $8,000 per annum. There has been no change in the Presidency of this company since January last. About 100 tons of ore per day are still hoisted to the surface, and a reserve of some 2,500 tons are on hand at the dump pile and in the ore house. The fracture of a cylinder at the reduction works suspended operations for ten days this month, but the mill is now successfully at work again. The drift from the Bonner shaft has been driven 120 feet to the west, at the end of which, cross drifts, running north and south, are to be started.

Yellow Jacket is in some favor, steadily advancing from $1,300 to $1,390, seller 30, and $1,450 cash, then selling at $1,340, and closing at about $1,320. Within this range 99 feet were sold. The new shaft has attained a depth of 125 feet, and the present working shaft is being sunk from the 360 feet station, for the purpose of developing a new level at a depth of 430 feet. Arrangements have been made with a number of mills to crush ores for this company at $17½ per ton (a reduction of $2½), and the product of the mine has exceeded 1,000 tons this week. Important additions are being made to the Morgan mill, and its reduction capacity is to be increased to 100 tons per day.

Savage has not fluctuated materially, and 130 feet were dealt in, dropping from $1,175 to $1,125, advancing to $1,210, declining to $1,140, advancing to $1,320, and selling yesterday at $1,275@1,260. The average yield of all the second-class ores crushed last month was $33.28, and the first-class produced about $100 per ton. The "horse" in the Potosi chimney has cut out all the ore at that point, except a body in the southeast corner. In raising a shaft in this horse, however, to connect with the second station above, a strata of ore, eight feet wide, has been disclosed. Between the third and fourth stations the ore has deteriorated in quality, and is now fair second-class mineral, but this body yet extends a distance of 28 feet in height. The new northwest body in the fourth level, near the Gould & Curry line, discloses good second-class ore, and is now the most promising deposit in this mine, some 20 feet square and 60 feet in height. The fifth level is to be opened as soon as practicable. The prospecting shaft sunk from the fourth level, a short time since, met with good ore, but nothing was ascertained as to the real character of the lode at this depth.

Alpha has been in decided request, and 162 feet were sold, rapidly advancing from $810 to $1,600, and closing yesterday at $1,475. It is said that in drifting north from the shaft, at a depth of 525 feet, a large body of fine ore has been met with, but owing to the peculiar reticence of parties in charge of the mine, we have no authentic advices as to the real character of recent developments. It is also stated that the sudden rise is purely a speculative movement, based upon the strategic combinations of a "bull" clique, and that the actual condition of the mine does not warrant present prices.

Belcher fell from $690 to $610, rose to $825, receded to $810, rallied to $820, and sold yesterday at $765@725. Within this range 108 feet have changed hands. There is nothing new to note in the appearance of this claim.

Crown Point rose from $775 to $900, dropped to $825, and closed at $785. Small sales were made. In the western portion of the 160 feet level a small body of rich ore, assaying $3,500 per ton, is now disclosed, and in sinking a shaft from the 260 feet level, good quartz, carrying pay mineral, is also met with. At the annual meeting of the stockholders, held last week, the old trustees and officers of the company were *unanimously* chosen to serve another year.

Ophir rose from $475 to $500, fell to $475, and sold yesterday at $495. The suit of the Burning Moscow *vs.* this company has been set for Monday next, before his Honor Judge Burbank. Hale & Norcross rose from $480 to $560, and is now held at $564. Empire Mill & Mining Company has been dealt in at $440@450 per share.

Chollar declined from $300 to $290, advanced to $400, and closed at $390. Potosi steadily rose from $295 to $395, and sold yesterday at $380@390. In all, 408 feet were sold. From the upper stopes of the latter mine some 700 tons of second-class ore have been taken recently, a portion of which has been sold at $10 per ton. Between the fourth and fifth levels of the south Chollar mine some 20 tons of fair ore are extracted daily, from a body about 10 feet in depth and 20 feet wide; and from the Potosi mine, near the shaft, about 20 tons of ore per day (worth some $40 per ton) are taken. The Chollar drift from the fifth level of the Potosi is now in the east wall of the ledge, and the new shaft is down about 43 feet.

Imperial has been a prominent feature of the market, and 2,551 shares changed hands, advancing from $167, seller 30, to $230 cash, receding to $192½, seller 30, rising to $250, dropping to $235, then rallying to $255, and closing yesterday at $225@210. The gross receipts of this company during the month of May were $54,674.52, and the balance brought forward from April amounted to $2,151.44. The general expenses were $40.370.24. The Rhode Island mill was paid $6.938.44; $1,797.25 were disbursed for legal expenses, and the Gold Hill Drainage Company was paid $3,338.33; leaving a cash balance on hand, June 1st, of $4.381.70. The company's mills reduced 2,423 tons of ore, averaging $18.98 per ton, and 374 tons were worked by the Rhode Island mill, yielding $21.65 per ton. It is now thought that the first body of ore found in the fifth level will prove less valuable than was anticipated. It is said to look well, but contains considerable base metal. Another deposit, lying to the east, has since been penetrated, very fine in appearance, but the extent of which has not yet been developed. A crushing of 10 tons of this latter yielded $69 per ton at the Petaluma mill. Similar ore has also been met with in the southeast drift, near the line of the Bacon Company. Receipts this month will be mainly from this body of ore. A new level, 70 feet deeper has been started and pay ore developed. The first shipment of bullion for the June account amounted to $13,726.75.

Burning Moscow is in much better favor, and nearly 1,000 shares were dealt in, rising from $48 to $62, and closing at $56. A recent crushing of some 15 tons of ore yielded $75 per ton, and more good ore is said to be in sight.

The aggregate recorded sales of stocks, at the Board, since Saturday last, amounted to $1,400,245.

SALES OF THE WEEK

BY THE S. F. STOCK & EXCHANGE BOARD.

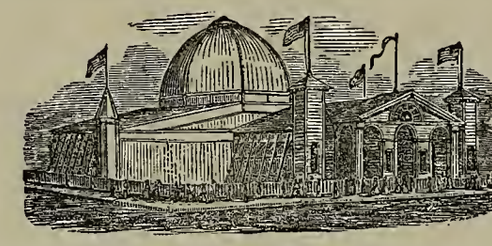
[Written for the Mining and Scientific Press.]

Letter from Amador County.

Messrs. Editors:—I had a very pleasant trip to Sacramento on the splendid steamer Chrysopolis, aboard of which I met my old friend, Jas. McWilliams, Esq., the gentlemanly President of the Fast Freight and Express Co., who was on his way to Virginia City. Before leaving, he kindly presented me a "*carte blanche*" by his line whenever I may wish to use it. After breakfast I left Sacramento by rail for Latrobe, and took stage from there to Ione City, Amador county, where I stopped some two days and visited several mining localities in that immediate vicinity. The great copper *furore*, which has monopolized everything else hereabouts during the last two years, seems to have subsided somewhat, and many parties who have spent large amounts in prospecting are now pausing and surveying the ground, and some their pockets, and find most of their loose change gone. Others have been more fortunate, amongst whom I may mention the Newton company.



The Newton ledge was located by Dr. J. Newton, and incorporated in Amador county by the Doctor, his brother and five others of the same family. They have all, except the Doctor, sold their interests to Mr. Meader, of Stockton. The present proprietors are running a shaft, which is now about 185 feet deep, and from which they have already taken out 2,000 tons of ore, several hundred tons of which have been shipped to Europe and the East, the entire amount of which has averaged over nineteen per cent. copper. A new steam engine is being put up for raising the ore by steam, instead of the single horse arrangement which they are now using. Everything is under the superintendence of Dr. Newton, whose judgment and energy are sufficient guarantees for the future. They are now working several hands, and shipping ore to San Francisco regularly. A report will be made in a few days, intended for publication, in which the exact figures will be given.

Leaving the Newton mine, I came to this place, Jackson, the county seat of Amador, and one of the most beautiful towns I have visited in the mountains. The business portion of the town is substantially and compactly built, and bears evidence of thrift and prosperity. This fact is wonderful when it is recollected that less than three years ago almost the entire place was destroyed by fire. The suburban portion of Jackson corresponds with the business; beautiful rose and vine-embowered gardens, complete the picture. I had the good fortune to meet here an old acquaintance, J. H. Bradley, Esq., of Pine Grove, to whom I am indebted for many favors. Mr. B. and myself visited several ledges in this vicinity, and I obtained some valuable information. The first we visited was the Hinckley ledge, which was accidentally discovered by the mason who built Mr. Hinckley's house, who on knocking out a rock for the foundation perceived that it contained gold, and on crushing it some $300 was taken out. A shaft was sunk and a pocket struck which yielded over $4,000. Mr. Hinckley made a visit East, and on his return found some $6,000 more, making in all over $10,000 in a few months, principally crushed by hand. He is now sinking his shaft deeper, and taking out rich rock. Within a few hundred yards of this is a ledge named the Coney, the largest of any yet discovered in this district. It is eight hundred feet long, twenty to forty feet wide, and a perfect mass of quartz. A shaft fifty feet deep has been sunk on it, from which one hundred and eighty tons have been crushed, with an average yield of over seven dollars per ton. This mammoth ledge is owned by Mr. Coney, of this place, and the Messrs. Bigelow Brothers, of San Francisco, who have shown their good judgment in selecting this county as a portion of their field of operation.

Jackson contains some elegant public buildings. Her churches are tastefully built, and correspond with the appearance of the place. The Court House is one of the best in the State, being built of brick, as are the principal houses. The hotels, of which there are five, are highly spoken of. The Union, at which I am stopping, is so well known as to require no remarks from me. Col. Allen, the worthy host, knows how to "keep a hotel." My thanks are due to Thomas A. Springer, Esq., of the Amador *Weekly Ledger*, likewise to R. M. Briggs, Esq., of the *Union Advocate*, for kindness and favors bestowed. I would like to speak of other matters connected with this place, but fear I have already overreached my bounds. More anon. L.

Jackson, Amador county, June 12, 1865.

THE FIFTH INDUSTRIAL FAIR

OF THE MECHANICS' INSTITUTE OF SAN FRANCISCO,

To be Held in the Mechanics' Institute Pavilion in August, 1865.

The Mechanics' Institute having determined to hold their Fifth Industrial Fair during the coming season, the Executive Committee would respectfully invite all persons desirous of exhibiting Machines, Manufactures, Agricultural Implements, Horticultural Products, Minerals, Ores, and Works of Art, to make application immediately, in order that the proper space may be allotted them.

The Exhibition will be open to the public on Thursday, the 17th day of August, at 10 o'clock A. M.

The general management of the Fair is entrusted to an Executive Committee, consisting of the officers of the Institute.

No contracts or agreements will be recognized unless made by the authorized agents of this Committee.

A competent person will be in attendance at the Pavilion to receive and register all goods designed for exhibition, and will receipt therefor.

Contributions of Machinery and other articles that require long time to prepare for exhibition, will be received from the 15th of July to the 2d of August.

Articles for exhibition that require large space may be entered on or before the 20th day of July, and space will be allotted to the exhibitor on or before the 2d of August.

The Picture Galleries will be ready for the reception of Pictures, Embroideries, Wax and Fancy Work of all kinds, on the 1st of August, when space will be allotted.

The Committee will be prepared for the reception of Fruits, Flowers, Agricultural and Horticultural Productions, and design to have the tables so arranged that the best display possible can be made in this department, and every effort will be made and care taken to preserve their freshness, so that exhibitors may receive full credit for their productions. Those wishing space on these tables should engage it at an early day. There will be space reserved for additions in this department during the Fair.

The several transportation companies, as on former occasions, have, with commendable liberality, consented to transport articles intended exclusively for exhibition free of charge, and Messrs. Wells, Fargo & Co., in like manner, will take charge of them.

The Committee have the fullest confidence that the coming Fair will not only be the most complete and varied in its character, but will also be more attractive than any previous exhibition of this kind on this coast.

No pains or expense will be spared to give the contributors satisfactory opportunities in the spacious pavilion of the Institute for the display of their contributions, and to furnish whatever may be necessary to make the Fair an institution where those who frequent it may be both pleased and instructed.

All articles forwarded should be labeled "For the Industrial Exhibition," San Francisco.

All communications to be addressed to C. S. Higgins, Corresponding Secretary.

EXECUTIVE COMMITTEE.

CHARLES M. PLUM, President.

JOSIAH MOULTON,	D. A. MACDONALD,
JAMES E. DEANE,	C. S. HIGGINS,
A. A. SNYDER,	DAVID DWYER,
W. W. HANSCOM,	H. K. CUMMINGS,
EDWARD NUNAN,	J. W. REAY.

P. B. DEXTER Secretary.

U. S. 7-30 LOAN.

By authority of the Secretary of the Treasury, the undersigned has assumed the General Subscription Agency for the sale of United States Treasury Notes, bearing seven and three-tenths per cent. interest per annum, known as the

SEVEN-THIRTY LOAN.

These Notes are issued under date June 15th, 1865, and are payable three years from that time in currency, or are convertible, at the option of the holder, into

U. S. 5-20 Six Per Cent.

GOLD BEARING BONDS.

These Bonds are now worth a premium of nine per cent. including gold interest from November, which makes the actual profit on the 7-30 loan, at current rates, including interest, about ten per cent. per annum, besides its EXEMPTION FROM STATE AND MUNICIPAL TAXATION, WHICH ADDS FROM ONE TO THREE PER CENT. MORE, according to the rate levied on other property. The interest is payable in currency, semi-annually, by coupons attached to each note, which may be cut off and sold to any bank or banker.

The interest amounts to

One cent per day on a $50 note,
Two cents per day on a $100 note,
Ten cents per day on a $500 note,
Twenty cents per day on a $1,000 note,
One dollar per day on a $5,000 note.

Notes of all the denominations named will be promptly furnished upon receipt of subscription. This is

The only Loan in Market

now offered by the Government, and it is confidently expected that its superior advantages will make it

THE GREAT POPULAR LOAN OF THE PEOPLE.

Less than $300,000,000 of the loan authorized by the last Congress is now on the market.

This amount, at the rate at which it is being absorbed, will all be subscribed for within four months, when the notes will undoubtedly command a premium, as has uniformly been the case on closing the subscriptions to other Loans.

In order that citizens of every town and section of the country may be afforded facilities for taking the Loan, the National Bank, State Banks, and Private Bankers throughout the country have generally agreed to receive subscriptions at par. Subscribers will select their own agents, in whom they have confidence, and who only are to be responsible for the delivery of the notes for which they receive orders.

JAY COOKE,
Subscription Agent, Philadelphia.

March 25, 1865. 17v10-3m

ADDENDUM.

PER OVERLAND TELEGRAPH:

PHILADELPHIA, May 17, 1865

Second Series all sold. Commenced on Third Series. Two Hundred and Thirty Millions (230,000,000) precisely like other two Series, except dated 15th July, and Government reserves the right to pay six per cent. in Gold instead of 7-30 Currency.

JAY COOKE,
Subscription Agent, Philadelphia.

Our Patent Agency.

The Patent Agency of the Mining and Scientific Press has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

A CARD.

Mr. H. S. JACOBS, formerly of this State and Oregon, adopts this method of calling the attention of his old friends and customers to the fact that he has established himself permanently in the city of New York, having, since his residence in California, perfected and secured by letters patent his celebrated WHEEL-MAKING MACHINERY, which not only materially reduces the cost of manufacture, but makes a much more durable and finished wheel than by the old method. These facts are simply attested by the large and increasing demand for Wheels made by this machinery, as well as by the numerous testimonials furnished by parties who have purchased and tested them. Having made large contracts for timber, selected expressly for this purpose by a gentleman who has had an experience of upwards of thirty-five years, and whose entire attention is devoted to the selection of stock connected with this branch of industry, and having had myself an experience of eleven years in manufacturing in California and Oregon, and being personally acquainted with the sizes, styles, material and wants of these States, I feel the most entire confidence in being able to supply the trade with a better and cheaper article than can be had from any other source, and in whatever quantity may be desired, having on hand at present one of the largest and best assorted stocks of Omnibus, Truck, Cart and Light Wagon Wheels, of all sizes, together with a varied assortment of Hubs, Spokes, Felloes, Bent Rims, Shafts, Poles, etc., to be found in the country—all made under my own supervision and of the very best material and workmanship. All descriptions of well-seasoned Timber kept constantly on hand and supplied in any quantity. Orders for material of all and every kind pertaining to Wagon manufacture will be filled promptly for cash on delivery.

Address, THE JACOBS PATENT WHEEL-DRESSING MACHINE AND WHEEL COMPANY, 99 Wall street and 145 and 147 Bank street, New York.

N. B.—Those desiring peculiarity of style in Hubs, Felloes, Spokes, etc., can be accommodated, and will receive our careful attention by sending samples of the same. [20v10

NOTICE TO MINERS.

THE UNDERSIGNED WILL SELL

MINING STOCK

In Incorporated Companies and Unincorporated Mines, in San Francisco District and in El Dorado District, Arizona Territory. It is confidently asserted and believed by most practical miners that Arizona is the richest mining country in the world. Recent developments of these mines are now attracting the attention of capitalists, who have already erected several mills, and more are going there soon. Now is the time to invest to advantage, and obtain the rise that must soon follow. Those wishing to purchase soon can do so, on most liberal terms, by calling on MR. ROBNEY CLARK, 338 Montgomery street (room No. 11), San Francisco, or on H. C. SKINNER, San Jose, California.

N. B.—Freight all the way by water at a cost of 4½ cents per pound.

H. C. SKINNER,
San Jose, California.

San Francisco, April 27, 1865. 17q10

1852. 1865.

Thirteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, The Golden Era is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

Liberal Terms to Clubs.

The Golden Era is furnished to CLUBS at the following rates: Three Copies, one year, Ten Dollars; Five Copies, one year, Fifteen Dollars; Ten Copies, one year, Twenty five Dollars. An extra copy will be forwarded, free, for one year, to the person sending a club of five or ten subscribers.

The Golden Era is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render The Golden Era a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome The Golden Era as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the Golden Era, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the Golden Era are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

IN THE GOLDEN ERA,

"THE FAIR LILIAS;"

Or, "LIFE IN DEATH,"

A New Story, by Pierce Egan, Author of "The Poor Girl," "The Flower of the Flock," "Lady Maud," "The Snake in the Grass," "Such is Life," Etc.

PIERCE EGAN is undoubtedly the most fascinating and attractive Novelist of the age. His stories are eagerly sought for, read and admired by hundreds of thousands in England and America. "The Fair Lilias; or, Life in Death," surpasses, in exciting interest and thrilling situations, all of the productions of the celebrated author, and is Pierce Egan's masterpiece.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

BROOKS & LAWRENCE,
Golden Era Building,
No. 543 Clay street, near Montgomery, San Francisco.

Mining Summary.

WASHOE.

According to the *Territorial Enterprise*, there are at this time quite a number of New York capitalists in Nevada preparing to develop mines in which they hold large interests. The mines in which they are interested are mostly in the new districts. All appear to be well satisfied with their prospects. Several companies, mostly made up of New York men, are preparing to erect mills. In Mountain Wells district, at La Plata city, some four or five mills will be built this season.

Lamoreaux's new mill, in the Desert district, has gone into active operation, and is crushing ore for the Almaden Company.

The Gold Hill *News* of the 10th instant says that a fine body of ore had just been struck in the lower level of the Alpha mine. It appears that at the depth of five hundred and fifty feet, in the northeast drift, a shaft has been sunk for prospecting a distance of sixty feet, and in that shaft the strike was made, the ledge being about thirty feet thick and abounding in rich sulphurets of silver. It is pitching sharply to the east, and is well defined. The same will at once be opened and more perfectly developed.

Several rich ledges of gold bearing quartz have been discovered, and a district laid out, on the Henness Pass route, eight miles from the summit, at the headwaters of the Nevada ditch, and near the line of Nevada county, California. In all about ten ledges have been located and recorded, and work enough done to prove them of great width, extent and richness. The new district is called Excelsior district.

REESE RIVER.

The *Reveille* hears of quite a number of mills on the way to Reese River, some from New York, Philadelphia, Boston, Chicago, and other cities in the East, and of others made in Marysville, Sacramento and San Francisco, and thinks there is a fair prospect that, before the year is out, they will have as many mills in that region as are now found at Virginia City. The *Reveille* infers that these mills will necessitate various branches of manufacture, such as foundries, machine shops, etc., which will add materially to the prosperity of that region.

Several companies in the Peruvian district have been compelled to suspend operations in consequence of the hostile presence of the Indians.

The mill formerly located at Jacksonville, and owned by S. B. Martin, has been removed to Silver Peak district, where a mill is much needed, and where it is confidently predicted the investment will be remunerative to all parties concerned.

A new district called the Empire was formed in April last, just east of Sand Springs, Churchill county, where the indications are that a rich country exists; the only drawback being wood and water, both of which have to be hauled five miles. Quite a number of companies have already located claims.

HUMBOLDT.

Mr. J. Voshay, of Humboldt, left San Francisco on the 3d inst. for New York, taking with him about half a ton of the finest silver-copper ore ever produced in Humboldt. The rock was pronounced worth half its weight in silver. This ore was from the Black Rock country, and the claim from which it was taken is called the "Balmoral." Mr. Voshay goes East to interest capital for its development.

The Rochester claim is reported as turning out well. It was so called from the city of that name in the State of New York, where its shares were reported as selling, at last accounts, as high as $300. It would appear that there is something in *that* name at any rate.

Additional discoveries are reported in the Sacramento district. One ledge, in particular, of unusual richness is reported. The Humboldt river has reached a high point of overflow, covering all the level land along its banks, and spreading its waters far out into the meadows and sage brush.

ESMERALDA.

Twenty-nine tons of ore from the Home Stake claim, Bodie district, lately crushed at the Bodie mill, yielded $2,500. The bullion produced was worth according to assay, $10.76 per ounce. Messrs. J. W. Bideman and Wm. Pooler, two very worthy, industrious miners, are among the lucky owners.

The Aurora *Union* learns from Mr. J. S. Jamison, who recently returned from the Blind Spring District, that the mining prospects there are looking very flattering. Work is progressing rapidly on several claims, and the ledges are improving as they are being developed. Sites have been located for two smelting furnaces, both of which will be speedily erected.

The reports from Columbus district are more favorable than ever before. Capital is beginning to find its way there, and the mines are being rapidly developed.

The *Union* is informed that the agent of some New Yorkers has been instructed by telegraph to buy the machinery of the Durand mill, which was burned down here last year, for the purpose of placing it in a mill to be erected in Montgomery.

The Wide West and Golden Age & Empire companies have levied assessments and are going to work in earnest on their mines. The *Union* thinks that if a few more of the principal mining companies would go to work times would soon be lively.

The Empire Mining Company, of New York, have struck a rich "pay streak" in their New Mexico claim at Bodie. Their mill will soon be in operation.

CALIFORNIA.

Our gold quartz mining interests appear to be steadily though slowly improving, and the conviction appears to be very general that the deep and permanent mining of California has but just commenced. The great and inexhaustible wealth of our mines is now universally acknowledged, and capital alone is needed, aided by the earnest blows of industry, to increase their yield to an almost unlimited extent.

Sierra, which has long been noted for the extent and richness of her placers, is fast taking a prominent rank as a quartz mining county. The Reis, the Woods, the Keystone and the Ironsides are taking out rock which will compare favorably with that of Grass Valley. Several other companies are also expending large sums of money freely in anticipation of future results as a recompense.

The Pittsburg Company, at Potosi, after a run of five weeks—only about four weeks full time—took out 620 ounces of dust, which, notwithstanding a good deal of expense on repairs, paid a dividend for the month of April of $1,288 to the share.

Tewey, Kingdon & Co., placer miners, of La Porte, made their first clean up a short time since, and panned out 250 pounds of very dry amalgam.

Plumas.—The Blue Rock Company's claim at North Fork is paying an ounce per day to the hand. Orton & Harris' claim is paying from eight to ten dollars per day Van Sickle & Co. have struck a splendid prospect in their tunnel. Over $2,000 were taken out of the surface claims of J. L. Peel, in Round Valley, for five weeks work of five men. Niles & Co's claim, on Rich Gulch, is paying from fifteen to twenty dollars per day to the hand.

Nevada.—The incline in the Gold Tunnel Co.'s claim has been sunk one hundred and five feet below the bed of Deer creek. The quartz taken out is of excellent quality, and the owners of the claim are determined to work it as thoroughly as any mine in the county.

The cement claims at Brandy Flat, near Washington, recently owned by McGee and now by Mr. Woolsey and others, are being worked with the greatest success. The *Transcript* says that the cement which is being taken out is literally filled with gold. $1,000 has been taken from a single car load of this cement.

Butte.—The *Appeal* says that the Jefferson Company, at Brown's Valley, after three days' run, have cleaned up $2,500—that is a little over $800 a day. The company have again struck their old ledge and are taking out as good quartz as ever. This fact will revive business again at Brown's Valley.

Placer.—The Layne silver lead, says the Auburn *Stars and Stripes*, has been so fully developed as to have demonstrated its character as an extensive, well-defined and rich lead. One hundred feet of the main lead was recently sold for one thousand dollars cash, and one hundred feet of an extension for three hundred dollars. This appears to settle the question of the existence of productive silver mines in Placer.

Calaveras.—The San Andreas *Register* says that from one bucket full of dirt and broken quartz, scraped up in the bottom of the shaft of the Rathgibs claim, thirty-two ounces of gold were washed out a few days since. A gentleman from San Francisco has visited this claim, with a view of purchasing it for parties in New York. This is the richest claim that has yet been developed in this section of the county.

Parties from San Francisco are talking of erecting a quartz mill on a lead near Donnallan's bridge, about a mile and a half from town.

A quartz claim at Jenny Lind has been sold to a company from San Francisco, for $75,000, with the proviso that the parties selling may take nine tons of the rock to San Francisco, and if it averages $20 per ton, they are to be paid $100,000 for the claim.

The Keystone mine, according to the Copperopolis *Courier*, is now looking very well. In one of the drifts the lead—three feet of which is solid No. 1 ore—is about six feet in width. This is in the shaft near the Union line. Under the judicious management of the present superintendent, Mr. H. H. Sheldon, the mine is being placed in good working order. There is an abundance of good ore in sight, and thousands of tons can be taken out at the pleasure of the company.

Amador.—We learn from the *Ledger* that the Tellurium mill, at Pine Grove, was completed and put in operation the present week. It will work from sixteen to twenty tons per day. The company have spent two years of time and about $25,000 on their mine, but have every prospect of being soon amply rewarded for their faith and perseverence.

The Irishtown mill will be completed in a few weeks. One of Hansbrow & Redding's hydrostatic engines will be the propelling power.

Knight & Co. have commenced the erection of a sixteen stamp mill on the Coney lode and will have it in running order in a few weeks. This lode is fully described by our traveling correspondent.

The Kearsing mill is crushing rock from the Bright lode, near Jackson.

McKnight, on Sutter creek, above Volcano, is attaching several stamps to his arrastra mill, and Sarraco & Co. have placed a fine engine on their mine at Else creek for hoisting rock and water.

The San Francisco company, on Else creek, are putting a more powerful engine on their mine, and will prospect their rock to a great depth the present summer.

Hayward & Chamberlain have torn down the old Badger mill and are engaged in erecting a fine new one in its place.

Seaton & Co., at Drytown, are now adding twenty more stamps and making other improvements to their already fine mill.

Quartz mining in Amador, says the *Ledger*, is receiving a new impetus, and set us down as a false prophet if her gold yield, large as it now is, is not doubled two years hence. Very many lodes of known value are now lying unworked for lack of mills. A hundred more good ones could be profitably employed, and will be eventually.

Tulare.—The Visalia *Delta* speaks very encouragingly with regard to the mineral prospects of Tulare county. The mines of that county are attracting much attention from San Francisco capitalists. That paper of a recent date says that J. C. Birdseye passed through Visalia a few days previous for the purpose of erecting mills on White river and likely at Clear creek. Messrs. F. C. Wood and George Roberts have bought interests in the regions named. These are all gentlemen of wealth and energy and just such men as we want, and as Tulare has long required to develop her hidden wealth.

By-Laws of Bear Creek Petroleum District.

In pursuance of previous notice given, the claimholders of Bear creek oil region, Colusa county, assembled at Simmons Hotel, on Monday, June 5th, 1865, for the purpose of forming a Petroleum Mining District, at which meeting the following rules and regulations were adopted:

Whereas, The United States authorities have declared that Petroleum lands shall be held and subject to the same rules and regulations as mineral lands, therefore the petroleum miners and claimholders of this region do hereby adopt the following rules and regulations for the government of this district.

Sec. 1. This district shall be known by the name of Bear creek Petroleum District, and is comprised within the limits of the township known as 14, north range 5, west, and extending one mile west thereof the length of the township.

2. The officers of this district shall be a District Recorder and a District Surveyor, who shall be elected to serve for the term of one year, and until their sucessors are elected and assume the duties.

3. It shall be the duty of the Recorder, upon proper application, to record and number all claims located within the limits of this district; to record deeds of transfer; to record the amount, kind and value of all work performed upon the claims. He shall keep a map of the district, upon which he shall note the location of all claims recorded. He shall keep a copy of all laws made for the government of the district and the minutes of all legal miners' meetings, which, together with the books of record, shall at all times during office hours be open to the inspection of the public. For his service he shall receive the following fees, to wit: For recording each claim, one dollar; for recording each deed of transfer, three dollars; for recording work performed and giving certificate, fifty cents.

4. It shall be the duty of the Surveyor to survey the claims of all persons desiring his services, and his survey shall be considered valid under the laws of this District. He shall furnish to the person for whom the survey is made, a certificate of record of the survey, fully describing such claim, giving boundary, location, etc. He shall keep a map of the District, showing the location of each claim; and as soon as each claim is surveyed and recorded he shall mark such claim with a number, and in a key to such map he shall set such number opposite to the name of the person locating such claim. He shall perform such other duties as his position may require. For his services he shall receive the following fees: For surveying each claim, five dollars, and for each day more than one required to make such survey, five dollars per day; and for other services, the same fees allowed to the County Surveyor. All necessary assistance to be furnished by the person locating the claim.

5. A claim shall consist of one hundred and sixty acres, to be located according to legal subdivision.

6. No person shall locate more than one claim in his or her name, within this District.

7. Each person locating a claim may have the same surveyed by the District Surveyor, and shall have the same recorded by the District Recorder within ten days from the date of location. When the survey is being made, stakes or monuments must be erected at each corner of the claim, having plainly marked thereon the initials of the claimants.

8. There shall be no company locations, but each claim must be surveyed, marked and recorded in one individual name.

9. There shall be placed upon each claim located within ninety days after location, improvements to the value of one hundred dollars, if not already upon it; and each claimant shall do a sufficient amount of work upon the claim each three months to show that he has not abandoned the same. But if he shall not, either by person or agent, be in possession of said claim once in three months, his claim shall be deemed forfeited and subject to re-location.

10. Claimants that wish to unite for the purpose of prospecting their claims, may, by filing a notice with the Recorder to that effect, select any one of the claims belonging to such persons and perform upon that claim the amount of work necessary to hold each claim; and such claims shall be credited with the amount due from each.

11. Within ninety days after location each claimant shall certify to the Recorder that he has placed upon his claim improvements to the value of $100, and he shall receive from him a certificate to that effect.

12. Unless claimants comply strictly with the requirements of these rules and regulations, their claims shall be deemed abandond and forfeited, and the Recorder is hereby authorized to record any re-location of such claim.

13. These laws can be changed only by a meeting of claimholders within the District, called together at the Recorder's office, by notices posted in ten conspicuous places within the District, and advertised in any newspaper published in this county, for three months prior to such meeting. And such notices must be signed by at least twenty full claimholders in the District. And at such meeting each claim within the District shall be represented by one vote.

Thomas Taylor was elected Recorder and J. W. Reed was elected Surveyor for the District. The following resolutions were also adopted:

Resolved, That the members of this meeting do recognize and will respect all claims heretofore located under the possessory act of California, and for ten days from this date no forfeiture of such claims shall work against the claimants. And the Recorder is hereby instructed not to record any re-location of claims except under the provision of Section 12.

Resolved, That the proceedings of this meeting be recorded in the Recorder's office of the County of Colusa, and be published in The Colusa *Sun*, and the Mining and Scientific Press of San Francisco.

GEO. W. GILBERT, Chairman.
C. B. Hughes, Secretary.

Another new Process of Enoraving.— A layer of finely pulverized chalk is compressed and smoothed by hydraulic power on a metal plate. The artist draws on this with an ink which makes the lines hard. A soft brush or a piece of velvet rubbed over the plate leaves the inky portion in relief. The whole plate is then saturated with a chemical solution, which turns the chalk into stone, somewhat analogous to Ransome's principle seemingly. From this impressions may be taken, or electrotypes obtained. The cost of these "graphotypes" is said to be something like one-tenth the cost of wood-blocks.

It is Impossible for editors to KNOW ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:

Saturday Morning, June 17, 1865.

Removal.

The Office of the MINING AND SCIENTIFIC PRESS has been removed to the old printing stand known as Waters Bros. & Co., southwest corner of Clay and Sansome streets, opposite the Niantic Hotel (being one block south of our former location), where we may now be found, with more commodious apartments and an extensive JOB PRINTING OFFICE.

San Francisco, April 10th, 1865.

Canvassing Agents.

We would call attention to the following named agents of the MINING AND SCIENTIFIC PRESS as gentleman worthy of the countenance of any community which they may visit, and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the PRESS, will be acknowledged as a personal favor to us:—

Mr. Robert Lattimore—Amador and Alpine counties and the State of Nevada.

Thos. Poyzer, of Grass Valley, for Nevada, Yuba and Sierra counties.

A SCIENTIFIC MAN AMONG US.

In another column we have given a brief extract of some remarks made at the late Alumni meeting, in Oakland, by Dr. C. T. Jackson, of Boston. The report is far from full, and perhaps we have overlooked much that was really more interesting than what is given, still, as it stands, it will doubtless be read with much interest by all lovers of scientific progress. His remarks were in perfect keeping with the principal aim and object of his life, which has ever been devoted to the cause of science, and especially to its practical application in the development of the industrial and commercial progress of the world. The Doctor visits this coast primarily for the purpose of spending a few weeks with a member of his family, who resides in this city; secondarily, to obtain, by personal observation, a more full knowledge of the wonderful mineral resources of the Pacific coast, and incidentally with the latter, to serve his friends and the public in whatever field his services may be required, as a mineralogical and geological expert. No native born American citizen, at the present time, stands higher in his peculiar departments of science than Dr. Jackson; and it may be considered especially fortunate for Californians that he has come among us at this particular juncture, to add the weight of his influence in favor of California abroad—for we entertain no doubt as to the result of his observations and explorations among our mines. The report which he will give the world, on his return, will be of more importance to California than that of any scientific man who has ever visited our shores. The Doctor is well and favorably known by most of the learned men of Europe, as well as those in our own country, as will hereafter appear, and his reports for good or ill, will have great weight with such men in their estimate of the resources of the Pacific coast.

From his earliest youth Dr. Jackson has been devoted to the study and development of the sciences—especially to the sciences of electricity, chemistry, mineralogy and geology, as applied to mining. Before he reached his fifteenth year he had acquired a strong taste for the two former. At twenty-four years of age, in connection with Francis Alger, of Boston, he published, in the *American Journal of Science*, edited by Prof. Silliman, a mineralogical and geological report of Nova Scotia. Three years afterwards, in 1832, while making a voyage across the Atlantic ocean, in company with Prof. S. F. B. Morse, he pointed out to that gentleman and others the possibility of establishing telegraphic correspondence by means of electricity, suggesting several ways by which it might be accomplished, and actually constructed and exhibited to several gentlemen in Boston, a working telegraph, six years before a similar apparatus was patented by Prof. Morse. Among his other scientific discoveries we may mention that of the anæsthetic property of ether, that of chlorine in meteoric iron, of fluorine in the scales of ganoid fishes, of a method of separating and preparing pure gold in the state of a metallic sponge, by the action of potash and oxalic acid or its chlorine solution. He has also made numerous important and valuable discoveries of minerals and fossils, among the latter we may mention that of tin in Hampshire, and of the same metal in an ore sent hence from Los Angeles in this State, where no such metal was suspected. He was the first to make known to the world the wondrous wealth of copper and other minerals about Lake Superior. The late important discovery of emery in western Massachusetts, was also made by him. Dr. Jackson has been successively appointed as principal or associate on the State geological surveys of Maine, Massachusetts, New York, New Hampshire and Michigan. His publications in this connection have been very voluminous. In addition to his mineralogical and geological researches on our own continent, no educated American has spent more time among, or more thoroughly examined the various mines of Europe than has Dr. Jackson.

As an evidence of the appreciation in which he is held abroad, as a scientific man, we may state that the French Academy of Sciences decreed a prize to him of 2,500 francs for his anæsthetic discoveries. He also received from Louis Napoleon, in 1840, the Cross of the Legion of Honor; from King Oscar, of Sweden, a gold medal struck especially for him; the Order of the Red Eagle from King Frederick William of Prussia; also, other orders and decorations from other rulers and lovers of science. No American, as we have already said, has been more honored than he, for his efforts in behalf of science. Those of our readers who would learn more of him can do so by reading his biography in the ninth volume of the new *American Cyclopedia*, from which we have chiefly obtained the above facts.

In closing this paragraph, we may be allowed to add the further and later testimony of L. Elie De Beaumont, Perpetual Secretary of the French Academy of Sciences and Inspector-General of Mines. After learning that the Doctor purposed to visit the Pacific coast, he wrote in substance, that Dr. Jackson has examined more extensive mineral districts than any other geologist in the world, and expresses the hope that on the completion of his mineral researches on this coast, he will publish in full a detailed description of the numerous mines he may examine, and the mineral lands he may explore; adding that the mines of the Pacific coast need examination by one who is fully capable of understanding and explaining their phenomena, and the origin and phenomena of veins generally.

LOG DRIVING ON THE TRUCKEE.—It has generally been supposed and often asserted that log-driving could not be successfully carried on upon the Truckee river. The practicability of such operations has been fully proved, however, the past season, by Lent & Co., who have cut 3,000,000 feet of pine logs within six miles of Lake Bigler and driven them successfully down the river, twenty-five miles, to Eastman & Co.'s mills, from which point the sawed lumber can be made readily available for a market.

GOLD IN THE SACRAMENTO RIVER.

There can be no question but that a large amount of gold is constantly coming down the Sacramento river, with the debris of that stream, to points even far below Sacramento. In order to give this matter a practical test, Mr. Salmon has recently procured several sacks of sand from the beds of the Sacramento and American rivers, and worked the same in his amalgamator in this city. He has furnished us with the following results of his experiments in this direction:

A quantity of fine, light quicksand, taken from the American, just below Folsom, yielded at the rate of $3.08 per ton. A lot of a heavier character, containing much black sand, which packed quite hard as it was deposited, yielded as high as $9.95. A lot of sand, of a very light character, taken from below Sacramento City, yielded $4.50. Some two or three hundred pounds were worked of each lot. The gold taken from the several lots, which was submitted to our inspection, was exceedingly fine. These samples were taken from the surface, in each instance. If they can be relied upon as correct, and we see no reason why they should not, the fact which is disclosed is of much importance, and proves quite conclusively that the bed of the Sacramento must eventually become of much value for mining purposes. If the sands of that river contain the amount of gold above indicated, at the present time, there can be no doubt but that their relative value will be materially increased with the lapse of time. To any one who has carefully considered the nature of gold and gold mining, and the rough manner in which mining is now and ever has been conducted, there is nothing at all strange or improbable in the results furnished us by Mr. Salmon; they merely furnish additional proof of what we have repeatedly asserted. If gold is actually found to exist in anything like the quantity indicated, in the lower Sacramento, ways and means will soon be devised to obtain it—perhaps, indeed, we may already possess the requisite facilities for that purpose.

We have long been impressed with the fact that an entirely new method of placer mining should be devised. The large volume of water now employed in all our sluicing operations cannot but be attended with an immense loss of fine gold. Let any miner who doubts this assertion take the tailings which may accumulate, but for a single day, around the foot of a sluice, separate them, by screening, so as to collect nothing but the fine sand, and submit that to a careful process of panning and amalgamating in a quartz mill, and we confidently believe that all doubts will be removed. We are under many obligations to several parties for the results of experiments in this direction, which have been furnished us, and should also be much obliged if any of our correspondents could prove, by actual experiment, that our supposition with regard to the loss of fine gold, is not correct. Our object is to arrive at facts.

SERVED THEM RIGHT.—It is said that the Rothschilds, through their American agent, Belmont, were induced to invest one hundred millions in Confederate bonds, which to-day are not worth the paper on which they are printed, while not a dollar of their money has gone to sustain the Federal Government. When foreign capitalists appoint for their financial agents in this country men noted for their hostility to our Government, it is a matter of congratulation rather than otherwise that their money goes out never to return.

A BRONZE STATUE of Thomas H. Benton has arrived at St. Louis, the work of the eminent female artist, Miss Harriet Hosmer. It was ordered by the Legislature of Missouri, and cost about $5,000. The statue was cast at Munich, in Bavaria, and is ten feet in hight. It is highly spoken of as a work of art.

THE Atlantic cable will be completed and on shipboard by the last of the present month. We may expect to hear from England, by telegraph, by the middle of July.

BODEMANN AND KERL'S ASSAYING.—We acknowledge the reception of a copy of the above work, translated by W. A. Goodyear, and illustrated with plates. This valuable work is published by John Wiley & Son, of New York, for the Berzelius Trust Association of that city. The publication was designed as a guide for metallurgical students in the laboratory of the N. Y. Sheffield Scientific School, but will be found especially serviceable for persons pursuing metallurgical studies on the Pacific Coast. In fact it is the only really valuable work of the description accessible in California. It is just the thing needed here in view of the rapidly increasing mining interests on this coast. The work treats on the assaying of lead, copper, silver, gold and mercury, and the name of Bruno Kerl is a sufficient guarantee of its accuracy in every department. It contains many methods of assaying by the wet way not generally known, even to old experts. As instances, we may mention those relating to the use of acids in assaying poor lead ores, and alloys of lead. The work will recommend itself to a large class on account of portability and economy; and it will be especially welcomed by Germans, as its proportions are based on German standards of weights; in many instances, however, the corresponding French centigrade standards are also given. It would have been well, however, if the translator had taken the trouble of proceeding a step further and reduced the same to English equivalents, which are really the great base of commercial calculation. In addition to the ordinary topics contained in treatises on assaying, many others have been added thereto, which will be found interesting and valuable to the student in metallurgy. The book is for sale by H. H. Bancroft & Co.; price $3.00.

FROM THE COLORADO.—We have received a call during the past week from Mr. George E. Willete, superintendent of the Colorado Quartz Mill, in El Dorado Cañon, who visits this city for the purpose of procuring supplies for the mill, etc. Mr. W. brings favorable reports from that region. He also brings us samples of rock salt from the salt mountains located some sixty miles above El Dorado Cañon, up the Colorado. The salt is in large beautifully transparent crystals, and is probably of the finest quality attainable on this coast. Just previous to the time at which Mr. Willete left the Cañon, a pack train arrived from the salt mountains with a load of salt from the mill. These mountains are said to be a perfect mass of beautifully chrystallized salt, and are a great curiosity and wonder to all travelers who have visited them. One of them is within six miles of the river and the other is about twenty miles distant. The packers chop it out of the mass with axes.

MR. GOODYEAR, the translator of Bodemann & Kerl's assaying, elsewhere noticed, has associated himself professionally with Mr. T. A. Blake, who has recently returned to this city from the East. These gentlemen propose to devote their attention to civil and mining engineering in California and Nevada. Any communication addressed to Goodyear & Blake, San Francisco, through the Post Office, will be promptly attended to.

A MR. TALBOT is producing a "sensation" in Virginia City, by shooting apples off the head of Captain Clarkson, with a pistol, at a distance of thirty feet. Somebody will be killed, one of these days, by such foolish and useless shooting; in which event somebody else ought to be hung.

FROM CITY TO MOUNTAIN.—The Pennsylvania Gold and Silver Mining Company are preparing to remove their principal business office from this city to the locality of the mine, at Silver Mountain, Alpine county.

BUSINESS OF MONTANA.—It is said that seventeen steamers would leave St. Louis for Eastern Montana this season, laden with passengers and freight, for the mines. The old fur-trading house of Choteau & Co. have a stock of $600,000 worth of goods at Fort Benton.

PETROLEUM MATTERS.

Mr. W. M. Gabb, of the Stato Geological Survey, who has reeently returned from a trip to the southern coontics, has visited and exnmined o large number of oil springs, from the cha-ueter of which he predicts that the production of kerosene and mineral lubricotlng oil will eventually become nn important branch of the industrial products of this State. The natural flow of several of the springs which he visited he thinks will bs sufficient to warrant the construction of refineries, even without sinking wells for any increaso of yield. The oil he considers fully equal to that obtained in Pennsylvania.

Six twenty-galloo easks of crude oil wers brought down from the Uniou Mattole Oil Company's well, on ths Del Norte, which orrived on Monday lost. This is the first shipment of oil from a producing well in that section of the State, and olthough not large in quantity, may be considered os the preeursor of a lucrative business, which must soon grow up in the oil business of this coast. The oil is of n dark eolor, but sufficiently pure to buro in n lamp, without much inconvenience. The success which hos nttended ths labors of this eompany is still bcing sensibly felt all through the State, and has inspired n confidence in the oil business which has not heretofore been felt on the Pacific coast. The Union Company havo ere this got n pump nt work in their well to tcst its producing capacity. They will not sink their preseot well any deeper; but hnve commenced boring operations for a new well near by, which will be carefully tubed for permanent work. Quits a number of other eompanics in that vicioity are now either boring or making active preparations for doing so.

The Puragon Company, adjoining the Union Mattolc, arc pushing ahead vigorously since the strike of the latter. The lands upon which this compony is located were put into the hands of Tobey & Co., Petroleum Agents, on the 1st of June, since which time n eompany has been incorporated, the stock subscribed for and issued to the stockholders. Ths lands of this company adjoin those of the Union Mattole claim, with the same indications of oil. A full set of tools for boring and provisions for thres months will be shipped to the mine by the steamer Del Norte, on Tuesday next. Robert Kirk, the Presidcnt of the Company, goes up to build n house and superintend the boring of a well.

Tbe Humboldt Oil Compaoy is ths name of an organization which filed its incorporation papers ycsterday. Capital stock $600,000, divided in 12,000 shares. Locatioo, 320 acres of land on the north fork of tbe Mattole river. W. H. Tobey, President; D. S. Cutter, Secretary and Treasurer; Robert Kirk, W. M. Tobey, I. Frecborn, J. L. Samuels and D. S. Cutter, Trustees. A sst of tools will go up to this claim by the steamer of ths 5th of July.

The Buena Vista Petroleum Company, in Tulare Valley, has recently made a new election of Trustcss, and are oow cousideriog propositions received from Eastern capitalists to place their propcrty in the New York market, based upon tests of samples of the crude oil which has been sent tbere. The company are to hold another meeting ou Monday next, to act upon the proposition for the iocrease of their capital stock to $1,700,000.

The First National Petroleum Company, whose ground adjoins the Buena Vista Company, are taking active steps towards developing their claim. Scientific gentlemen, who have recently visited the locality of these claims, pronounce and publish most unhesitatingly with regard to ths favorable nature of tbe locations, and the large ultimate value of the property. The annual meeting of the stockholders of tbis company, for the election of Trustees, will be held on the 24th inst., at two o'clock P. M.

☞ Parties desirous of iovesting in town lots, ars referred to an advertisement in anotber column.

An extensive stove foundry and machine shop are being built at Silver City, Nevada.

From Mountain to City.—The Superior Copper Mining Company, of Butte county, have removed their principal office of business from the locality of the mine to this city.

SAN FRANCISCO

CORDAGE MANUFACTORY.

CONSTANTLY ON HAND,

A Large and Complete Assortment

—OF—

MANILA CORDAGE,

FOR MINING PURPOSES.

—ALSO—

WHALE LINE, BALE ROPE, ETC.,

Manufactured from Pure Manila Hemp.

Hoisting Ropes for Deep Shafts,

—ALSO—

Lines for Ferry Boats,

Manufactured to Order.

Office at **TUBBS & CO.'S,**

Nos. 611 and 613 Front street.

Manufactory at the Potrero. 14v10

JOHN TAYLOR & CO.,

—IMPORTERS AND DEALERS OF—

ASSAYERS' MATERIALS,

Druggists' & Chemists' Glassware,

Photographic Stock, Etc.

512 and 514 Washington Street,

SAN FRANCISCO.

WE are receiving direct from MESSRS. LADD & OERTLING (London) and BEEKER & SONS (Antwerp, Belgium) their superior

ASSAY AND BULLION BALANCES,

And from France and Germany, as well as the Eastern States, FURNACES, CRUCIBLES, MUFFLES, BLOW-PIPE CASES, GOLD SCALES, CHEMICAL GLASSWARE, and every article required for ASSAY OFFICES, LABORATORIES, etc. We have given this branch of our business particular attention, to select such articles as are necessary in the development of the mineral wealth of this coast.

A full Assortment of DRUGGISTS' GLASSWARE and DRUGGISTS' SUNDRIES, ACIDS and CHEMICALS, constantly on hand.

San Francisco, March 15, 1865. 11v10-tf

QUICKSILVER

FOR SALE BY

S. F. BUTTERWORTH,

Northwest cor. Battery and California sts.

v9-19 SAN FRANCISCO.

SAVE YOUR BOILERS AND FUEL.

ONE-EIGHTH OF AN INCH OF DEPOSIT ON THE fire surface of a boiler takes THIRTY PER CENT. of the steam generating power from that boiler, and, of course, wastes thirty per cent. of the fuel; and, what is a greater misfortune, it keeps the water from the plates and flues, causing them to scorch, blister and burn, destroying the boiler, and too often human lives.

I Have a Compound For Sale

That I have used with complete success in every instance, and without delaying the running of machinery, or injuring the boilers in any manner, and at a cost of five dollars the boilers can be made as clean as when they were new.

Apply by letter, or personally, to JOHN MAILEN,

Engineer of Pioneer Flour Mills, No. 515 Market street, above First (opposite the Oriental Hotel), San Francisco 23v10

A Valuable California Invention.

IMPORTANT TO OPERATORS AND DEALERS IN PETROLEUM, ETC.

CALIFORNIA

HERMETICALLY SEALED BARRELS,

—FOR—

TRANSPORTINO CRUDE PETROLEUM, KEROSENE, AND OTHER VOLATILE OILS.

WM. H. TOBEY & CO., having purchased the sole right of the United States and Territories to make and vend the above Barrels for the period of ten years, we are now prepared to enter into contracts with parties desirous of using such Barrels, to furnish the same, in any quantity, and at short notice. Samples may be seen at the office of Wm. H. Tobey & Co., Petroleum Agency, Room 28, Government House, San Francisco.

The above invention consists of a simple but effective preparation, which can be applied as a coating to any ordinary barrel of pine or hard wood, by which the same is rendered perfectly impervious to the most volatile substance known, thus rendering an ordinary barrel quite as safe a receptacle for Petroleum as a metal case, and at far less cost. Orders received as above by

WM. H. TOBEY & CO.

San Francisco, April 10, 1865. 17v10

LEHIGH COAL.

200 Tons Large Lump Lehigh Coal

Now on Hand.

I am also in constant receipt of

LEHIGH COAL,

And will be able to supply it always

At the Lowest Market Price.

JAMES R. DOYLE,

20v10-3m Pacific Coal Yard, 413 and 415 Pacific street.

A Tower of Skulls.—Lamartine, in his "Pilgrimage to the Holy Land," writes as follows:

When I was about a league from Nisa, the last Turkish town almost on the frontier of Servia, I saw a large tower rising up in the midst of the plain as white as Parian marble. I took the path which led to it. I desired a Turkish lad who accompanied me to hold my horse, and I sat down under the shade of the tower to enjoy a few moments' repose. No sooner was I seated, than raising my eye to the monument, I discovered that the walls which I supposed to be built of marble or regular rows of white stone, were composed of regular rows of human skulls, bleached by rain and sun, and cemented by a little sand and lime, formed entirely the triumphal arch which now sheltered me from the burning sun! There must be from fifteen to twenty thousand. In some places portions of the hair were still hanging, and waved like lichen or moss with every breath of wind. The mountain breeze was then blowing fresh, penetrating the innumerable cavities of the skulls, and sounded like a mournful and plaintive sigh. These were the skulls of fifteen thousand Servians, who had been put to death by the Pacha in the last insurrection of Servia. Servia, however, is now free, and this monument will teach their children the value of independence by showing them the price at which their forefathers purchased it.

The Mont Cenis Tunnel.—The *Official Gazette* of Turin publishes the latest returns of the progress made in piercing the tunnel of Mont Cenis. During the first quarter of the present year an advance of 337 metres has been made, counting both sides together. Last year, during the corresponding period, the progress made was only 235 metres. The whole length pierced on both sides on the 31st of December, 1864, was 4,086 metres, so that it is at present 4,423 metres, or a little more than a third of the whole.

THE BEST BOOK

—FOR—

MINERS, PROSPECTORS AND MILLMEN,

Nevada & California Processes

—OF—

SILVER AND GOLD

EXTRACTION,

For General Use,

BY GIUDO KÜSTEL,

Mining Engineer and Metallurgist—Formerly of the Ophir Works,

IN ONE HANDSOME OCTAVO VOLUME.

SYNOPSIS OF THE WORK.

PART FIRST.

Chapter 1st—Treats of the methods of recognizing silver and gold ores, and contains a "Systematic Proceeding" for their determination by blowpipe analysis readily learned and practised, and is a reliable and accurate guide.

Chapter 2d—Is a description of gold and silver ores, describing many interesting occurrences in minerals belonging to the Comstock, Gold Hill, Humboldt, and Arizona Mining Districts.

Chapter 3d—Describes the requisites and approved methods for testing and assaying—with Illustrations.

Chapter 4th—Speaks chiefly of the extraction of gold, especially the amalgamation treatment of ores in batteries, pans and arrastras; and also the extraction of gold by chlorination.

Chapter 5th—Is replete with valuable information on the extraction of silver, including divisions of processes employed. The behavior of chemicals by the wet process; the same when calcined—with valuable hints to attendants roasting ores. Full description for the cold and melting processes, etc.

Chapter 6th—Makes mention of the most modern utensils and machinery, such as pans, agitators, furnaces, etc., with comprehensive diagrams.

PART SECOND.

ON GENERAL METALLURGY.

Chapter 1st—Treats of many species of argentiferous ores; the dry assays of rich and poor ores; also, the same by the humid and dry methods.

Chapter 2d—Presents a clear and comprehensive description of the extraction of silver either by melting or amalgamating process—its dissolution and final precipitation—with divisions of the principal modes of extraction employed.

Chapter 3d—This last chapter gives full and precise formulas for the extraction of the metals in the dry way; the various modes employed in Europe and South America.

The "Amalgamation in pans" with chemicals, or dry method by calcination or roasting ores, forms the most valuable portion of the work; the same being thoroughly and distinctly described and explained, and particularly designed for the treatment of ores in Lower California, Arizona, Mexico, and other mining districts where argentiferous lead ores abound. No less valuable and important are the practical descriptions and illustrations of cupellation and refining of silver, and concentration of the same in lead, by the Pattinson and other processes.

This Work is invaluable to Prospectors, Miners, Metallurgists and Mill-men throughout the Pacific States, containing valuable formulas for the treatment of ores and minerals, expressly prepared in an authentic manner and a plainly written style, for persons engaged in mills in California, Washoe, Lower California, etc. It is also valuable to prospectors and miners unacquainted with mineralogy, having a full and clear chapter on Blowpipe Assays and Tests.

☞ That it may be within the reach of everybody, the **the price has been reduced to FIVE DOLLARS**

EUROPEAN

METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphurets, pyritous, and the (so called) "refractory ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

S. P. Kimball, J. R. Murphy.

SUBSTITUTE FOR BLASTING POWDER.—At Stockholm several experiments have been made with nitro-glycerine, in order to test its application as substitute for blasting power in mining operations. They were considered very successful, the new compound being found to be superior in its effects to the ancient method, and the price considerably less. Among other trials, a hole bored near the summit of a rock to a depth of 23 feet, was charged with 5½lbs. of nitro-glycerine. Five minutes after the fuze had been lighted a dull report was heard, and enormous blocks were detached from the rock. Several other mines were fired with blasting powder, but their effects were inferior to those of the nitro-glycerine.

SILVER ORE.—The value of the imports of silver into England during the first two months of this year was computed at £56,307, as compared with £390,070 in 1864, and £26,640 in 1863(corresponding periods). There has thus been a decided increase of late. It will be seen, however, that in the ten years ending 1863 the value of these imports made no progress. Thus, in 1854 it was £521 33 ; ; in 1855, £564,580 ; in 1856, £354,970 ; in 1857, £299,-511 ; in 1858, £209,154 ; in 1859, £342,637 ; in 1860, £388,806 ; in 1861, £289, 373 ; in 1862, £331,561 ; and in 1863, £272,826.

A London lamp manufacturer claims to have invented a lamp which will burn magnesium wire. By burning a strip of zinc in connection with two strips of magnesium, he is able to reduce the cost of the light two-thirds. He predicts that, in the course of time, it will be possible to illuminate a street a mile long at the rate of a half-penny an hour.

NOVEL EXPLOSION.—A half barrel of brewer's yeast, weighing 150 pounds, recently exploded at the office of the American Express Company in Milwaukie, Wisconsin. The barrel flew up to the ceiling, a hight of fourteen feet, and then bounded back again down through the floor.

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting machinery of the most approved construction, Flour, Saw and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

E. T. STEEN.

30 and 41 Fremont, and 42 and 44 Beale Sts.,

SAN FRANCISCO. 21v9tfq

The National Academy of Design has just occupied its new building on the corner of Twenty-third street and Fourth avenue, New York, erected at a cost of $220,000. The style of architecture is the revived Gothic, now the dominant style in England, which combines features of the different schools of architecture of the middle ages. The building is three stories high, 60 feet wide on the street, and 98 feet long on the avenue.

Cotton.—The *National Intelligencer* says the most sagacious merchants anticipate, in consequence of the increase in the growth of cotton in India and Egypt, a reduction in its price to ten cents a pound in another twelve month. Should this anticipation prove correct, it will effectually close up the cotton trade of India, inasmuch as the inland transportation there is so expensive as to preclude its export at so low a figure. Then will come the turn of America once more.

Quartz Mills in Lyon County.—There are in Lyon county, Nevada, 36 quartz mills—20 steam, 13 water, and 3 water and steam; stamps, 514; pans and tubs, 378; men employed, 344; wood used per day, 75 cords; quartz crushed per day, 588 tons.

Miners Convention.—The miners of Calaveras county are going to have a Convention to protect their interests against the encroachment of capital.

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

"Say, why should man for thirst be given
If not for wine bestowed by Heaven
To quench such drought as mine?
Without it, I'm a fish on land,
A barren heap of parching sand—
Then give me joyous wine."—*Trinkliet.*

Delicacy of flavor, exhilaration without intoxication, and every other desirable property belonging to the rightly fermented Juice of the Grape, are to be found in the "Gerke Wine," from the celebrated Bosquejo Vineyard, Tehama county.

There is no wine produced in California that can bear comparison with this, and it would be difficult to find a European wine, of the same class, that can surpass it.

The vintage of 1862 is now offered for sale, in quantities to suit, by the Agent of the vineyard,

A. S. LOWNDES,

Basement of the New York Hotel, southwest corner Battery and Commercial streets, San Francisco. 20v10-qy

HANSCOM'S CRUSHERS,

Made in sizes suitable for Breaking Quartz for Batteries; Rock for macadamizing or concrete; Copper Ore for sacking, sampling, or concentrating; also, for crushing Quartz for Arastras and Orinders. The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water, or Steam Power. For further information address W. W. HANSCOM.

I Golden State Iron Works, San Francisco.

HUNT'S PATENT
Circular Sweep Horse-Powers,

For running Churns, Washing Machines, Grindstones, pumping water, sawing wood, and other light machinery. Price, $100, at the Factory.

HUNT'S PATENT SELF-REGULATING TREAD HORSE POWER is superior to any machine of the kind in the market. Price, with Governor, all complete to set to work, at the Factory, $300. Manufactured by

E. O. HUNT,
17v10 28 Second street, San Francisco.

THE HAMMER QUARTZ MILL.

[PATENT APPLIED FOR.]

This Machine is now complete and ready for sale. In constructing it, our aim has been to produce a light, cheap and economical Crusher—one adapted to mining on a small as well as on a large scale.

The elementary principle on which it operates is that of the stamp—the only one really reliable and economical.

But the stamp has many serious disadvantages, among which are its great weight and small velocity; the great power required to run it; difficulty in feeding properly; imperfect discharge, and the necessity of crushing wet, or the annoyance from dust in crushing dry.

All these difficulties are obviated in our machine, and the percussive blow of the stamp retained, with the further advantage of its being a drawing or grinding one.

We give to our hammers such absolute or relative weight and velocity as we choose—just such as to effect their purpose and no more—thus securing the qualities of the natural hammer blow.

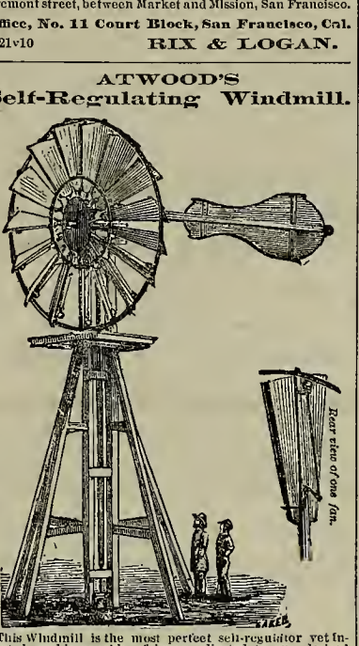
The feed is self-adjusting and uniform, and as fast as the ore reaches the required degree of fineness (which depends upon the fineness of the screen or sieve used), it is instantly discharged, so that there is no packing of the ore under the hammers.

The mill crushes dry, with no more dust than that incident to feeding, which is trifling.

As the only support of the mortar is a single post set into the ground, the machine can be put in place at slight expense.

The size now being built weighs about 1,800 pounds complete; the heaviest piece not weighing over 275 pounds. It is driven by half a horse-power, and crushes from three to ten tons per day of twenty-four hours per day, according to the character of the rock and the fineness to which it is reduced.

PRICE,.....$800.



Larger ones will be furnished if desired.

We invite an inspection of the Mill now in operation adjoining the Foundry of DEVOE, DINSMORE & CO., on Fremont street, between Market and Mission, San Francisco.

Office, No. 11 Court Block, San Francisco, Cal.

21v10 **RIX & LOGAN.**

ATWOOD'S
Self-Regulating Windmill.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,
SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

HUNT'S
IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN
HORSE POWER
For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

SALMON'S
PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock by this amalgamator, and assayed by Miller & Lunbaum, at Austin, Nevada:

	No.	Fine		No.	Fine
Assay	250	943	Assay	300	990
Assay	285	941	Assay for Czotman		980
Assay	286	940	Assay Water Rock		966
Assay	291	960	Assay Water Rock		998
Assay			St. Helena Ledge, W. D.		966

These, including a hundred other batches, were all worked to within fifteen per cent., and some to within ten per cent., of the assay. Parties interested will find it to their advantage to call and see the above machine in operation.

Manufactured at the San Francisco Foundry, San Francisco, California, by

J. & W. C. SALMON,

To whom all orders should be addressed. 15

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,

At the Novelty Iron Works, Nos. 37 & 39 Fremont street. 15-1m

BAUX & GUIOD'S
Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine Scientific Knowledge with Practical Experience, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; its small cost; its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

Lapidaries' refuse, Refiners' ashes, Jewelers' sweepings, purchased or worked for a percentage. Ores and tailings worked or assayed at reasonable rates.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8

FARRAND'S
Oscillating Amalgamator,

RECEIVED THE

ONLY PREMIUM

AWARDED FOR AMALGAMATORS

At the Recent Industrial Fair
OF THE
Mechanics' Institute of San Francisco.

Committee of Awards.

O. Belden, W. T. Carratt, H. P. Wakelee,
O. Coal, Geo. Johnson, C. M. Radcliff.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, whilst the loss by trituration is comparatively nothing.

4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.

5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY.

W. D. FARRAND, Inventor,

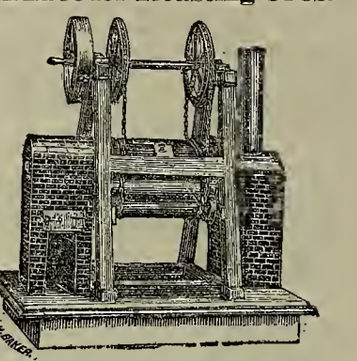
R. L. OGDEN, Agent, SAN FRANCISCO.

S. E. corner Montgomery and California streets. 10v9

NOTICE TO MINERS.

NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrels, altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.



B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast, amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, **B. FAUCHERY,**
Metallurgist. **Engineer,**

24v9

WM. BRUCKNER'S
Furnace for Roasting Ores.

Now in Operation at 416 Market street.

This Furnace, which is portable, and can be carried on mulcback, undertakes to roast without employing any labor whatever for the operation of stirring, which is accomplished by machinery that may be driven by steam or any other motor. It consists of an iron cylinder, which, being suspended by chains, in rotating mixes and stirs the ore, by an internal apparatus, quicker and more perfectly than can be done in any other furnace hitherto known in metallurgy. It can be applied to any kind of ore, and the rapidity and perfectedness of its operation, the great saving in fuel, and the entire saving of the labor usually required for stirring the ore, together with the small cost of constructing it, renders this furnace a most

Economical and Practical Invention.

The Furnace may be had of two sizes—one being nine feet in length and holding fourteen hundred pounds, and the other six feet in length, and holding eight hundred pounds. One horse power is required to drive the machinery of the larger sized furnace, and three fourths of a horse-power for the smaller size. Parties wishing to erect such furnaces will please communicate to

W. BRUCKNER,

5v10 No. 416 Market street, San Francisco.

BLAKE'S
QUARTZ BREAKER

Is now extensively used for breaking hard masses of

Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

CALIFORNIA, AUSTRALIA,
WASHOE,
ENGLAND, FRANCE,
— AND —
THE ATLANTIC STATES.

These Machines, or circulars containing further information regarding them, may be obtained of the undersigned. Address,

BLAKE & TYLER,

Box 2077 San Francisco Post Office.

CHAS. T. BLAKE, Idaho City. E. TYLER, Michigan Bluff. WM. F. BLAKE, San Francisco.

4v10

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and sellers for themselves, at the **PACIFIC FOUNDRY,**

1v10 San Francisco.

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th.

[Illustrated in the Mining and Scientific Press, April 9th, 864.] HEPBURN & PETERSON.

nov8 3m*

PRESIDENT LINCOLN AND THE MINES.—Mr. Speaker Colfax, who is now on his way, overland, to this State, comes as the bearer of a special message from our now deceased President to the miners of California. On the night of Speaker Colfax parting with President Lincoln, just before the latter was fatally shot, the proposed trip of the former to the Pacific coast being referred to, the President said:

I am glad you are going thither. Visit all the mining regions; tell the miners I have not forgotten them nor their interests; tell them I look to them to redeem this nation from its great debt; tell them the Government will do all it can to hasten the development of the vast wealth hid in their mountain sides and along their valleys. I shall encourage the soldiers to go there. I shall direct emigration thither. There is wealth there for individuals and the nation. Go, and do not forget to tell the miners we have them in mind, and are at work for them.

MINING EXODUS FROM ENGLAND.—The London *Times* of April 26th says:

Emigration has commenced at this early period of the year from the mining districts of the kingdom, and in South Wales it is beginning to be a frequent occurrence for forty or fifty hands to leave at every pay from the principal iron and coal works of the district. A few emigrate to Australia, Canada, New Zealand and other British colonies, but at least 90 per cent. are bound for the Northern States. The great inducement to leave the land of their birth is the reported high wages to be received in the States, and pamphlets and American newspapers are industriously circulated among the working classes, giving a glowing account of the state of the country. Unfortunately, a great number of the miners believe the statements made, despise the warnings adressed to them by even American citizens of position, such as the Mayor of New York, who has publicly condemned the proceedings of the American Emigrant Society in inducing emigrants to come over, with no other object than to secure cheap labor for the capitalist.

UNIVERSITY OF THE PACIFIC.—The commencement exercises of this university were held on Thursday of last week, and attracted a very large and deeply interested audience. The honors of the University were conferred upon seven graduates, whose orations, marked by vigor of thought, propriety of style, and a glowing patriotism, gave good evidence that their diplomas were fairly earned. The address of Dr. Cheney of this city to the Societies was eloquent and appropriate. This institution is certainly doing a noble work in the cause of literary education on the Pacific coast.

LITIGATION.—During the month of May, no less than four hundred and seven suits were commenced in the District Courts of San Francisco.

TRUSTEES:

ROBERT KIRK, T. O. OUFF, WM. H. TOBEY.

OFFICE:

At WM. H. TOBEY & CO.'S Petroleum Agency, Room No. 28 Government House, corner of Sansome and Washington streets, SAN FRANCISCO.

The claims of this Company consist of ONE HUNDRED AND SIXTY (160) ACRES of oil land, favorably located on the North Fork of the Mattole river, adjoining the grounds of the Union Mattole Company, Mattole District, Humboldt county, California. The Company are now actively engaged in the development of the claims.

San Francisco, June 14, 1865. 24v10

MINING COMPANIES and others connected with the Mining Interests of California, will find all possible desired information in the *Mining and Scientific Press* of San Francisco which is an ably edited Journal, smartly handled, and well up to the times. The Mining Companies of California, are awake to the advantages of having their Mining Notices, comprising Assessments, Dividends, Elections, &c., concentrated in the advertising columns of one Journal, as we notice in the issue of the *Press* of May 7th, there are no less than seven pages of this interesting matter.—*U. S. Mining Journal Railroad and Financial Advertiser, New York.*

Mining Notices--Continued.

Catalina Consolidated Mining Company,
Location, Catalina Island, San Pedro District, Los Angeles county, California.

And in accordance with law and an order of the Board of Trustees, made on the 5th day of May, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at the Secretary's office, on the 26th day of June, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

W. FELL, Secretary.

je10 Office, No. 53 Montgomery Block, San Francisco.

Caledonia Tunnel and Mining Company, Gold Hill District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 9th day of June, 1865, an assessment of three dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, No. 10 Government House, corner of Washington and Sansome streets, San Francisco or to James V. Coffey, Virginia, Nevada.

Any stock upon which said assessment shall remain unpaid on Saturday, the 15th day of July, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, July 29th, 1865, at 12 o'clock M., to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

je10 J. M. BUFFINGTON, Secretary.

Caldwell Gold & Silver Mining Company, Cove District, Tulare County, Cal.

The Annual Meeting of the Stockholders of the Caldwell Gold & Silver Mining Company, will take place at the office of the Company, No. 432 Montgomery Street, San Francisco, on Tuesday, June 20th, 1865, at 7½ o'clock, P. M., for the purpose of electing Trustees to serve for the ensuing year, altering of by-laws and such other business as may come before the meeting. By order of the Board of Trustees.

M. G. ELMORE, Secretary.

San Francisco, June 3, 1865.

Cortez Gold and Silver Mining Company,
Big Creek District, Lander county, Nevada.

And in accordance with law, and an order of the Board of Trustees, made on the 8th day of May, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at public auction, by Maurice Dore & Co., No. 327 Montgomery street, San Francisco, on Monday, the 19th day of June, 1865, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

W. W. KNIGHT, Secretary.

Office, 35 Exchange Building, corner Washington and Montgomery streets, San Francisco. my27

El Dorado Gold and Silver Mining Company,
Silver Mountain District, Alpine county, California.

ASSESSMENT No. 5.—Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 5th day of June, 1865, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company.

Any stock upon which said assessment shall remain unpaid on Saturday, the 15th day of July, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 31st day of July, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.
W. D. ROOT, Deputy Secretary.

Office, No. 410 Montgomery street, San Francisco.

NOTICE.—At the above meeting, assessment No. 1, levied July 8th, 1863, assessment No. 2, levied August 4th, 1863, and assessment No. 3, levied October 15th, 1863, of ten cents per share each; also, assessment No. 4, levied September 24th, 1864, of fifty cents per share, were rescinded, and stockholders having paid said assessments will be credited on the above assessment, No. 5, accordingly. Also, notice is given, that the additional amount of twenty cents per share (being properly assessment No. 5), was levied for the month of June, 1865.

J. WARREN CLARK, Secretary.
je10 W. D. ROOT, Deputy Secretary.

Evening Star Gold and Silver Mining Company, Trinity District, Humboldt County, Nevada.

Notice is hereby given, that a meeting of the Stockholders of the Evening Star Gold & Silver Mining Company, will be held at No. 410 California Street, San Francisco, on Monday, the 19th day of June, 1865, at 3 o'clock P. M., of that day for the purpose of altering the by-laws of the Company and of transacting other necessary business. A punctual attendance is requested, as subjects of importance to the Company will be presented. By order of the Board of Trustees.

N. DUPERU, Secretary.

Office, No. 710 Sansome street, San Francisco. je3

El Alamo de San Antonio Mining Company, San Antonio Mining District, Lower California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held December 6th, 1864, an assessment of one ($1) dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, 514 Bush street, San Francisco. Assessments paid on or before the 20th instant, ten per cent. will be allowed on the amount so paid.

Any stock upon which said assessment shall remain unpaid on Tuesday, the 3d day of January, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Tuesday, the 17th day of January, 1865, to pay the delinquent Assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

THOMAS RUTHERFORD, Secretary.

SUPPLEMENTARY NOTICE.—In consequence of an omission to advertise the delinquent stock on the above assessment on the day set forth—namely, the 3d day of January, 1865—the said assessment is hereby re-published, as by law provided; and in accordance therewith, any stock upon which said assessment shall remain due and unpaid on Saturday, July 1st, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, July 15th, 1865, to pay said delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

THOMAS RUTHERFORD, Secretary.

San Francisco, May 27, 1865. my27-td

Good Return Gold and Silver Mining Company, Inyo District, Tulare County, California.

T. J. JONES, Secretary.

Office, No. 728 Montgomery street, San Francisco, California. je3

Jewett Gold and Silver Mining Company
Works located at Gold Hill, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 22d day of May, 1865, an assessment of one dollar per share was levied upon the assessable capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 509 Clay street, in the city and county of San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the 24th day of June, 1865, will be advertised on that day as delinquent, and unless payment shall have been made before, will be sold on Saturday, the 10th day of July, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

A. M. COMSTOCK, Secretary

Office, No. 509 Clay street, City and County of San Francisco, California. my27

Kern River Gold & Silver Mining Company, Cove District, Tulare County, Cal.

The Annual Meeting of the stockholders of the Kern River Gold & Silver Mining Company, will take place at the office of the Company, No. 432 Montgomery Street, San Francisco, on Tuesday, June 20th, 1865, at 8 o'clock, P. M., for the purpose of electing Trustees to serve for the ensuing year, altering of by-laws and such other business as may come before the meeting. By order of the Board of Trustees.

M. G. ELMORE, Secretary.

San Francisco, June 3, 1865.

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

DEWEY & CO.,
Publishers and Job Printers,
Office Mining and Scientific Press, San Francisco.

Kelsey Gold and Silver Mining Company, Kelsey District. El Dorado County, Cal., San Francisco, May 31, 1865.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 30th day of May, 1865, an assessment, No. 18, of 30 cents per share was levied upon the capital stock of said Company, payable on the 31st day of May, 1865, in United States gold and silver coin, to the Secretary, at the office of the company, No. 16 Drum street.

Any stock upon which said assessment shall remain unpaid on Saturday, the 1st day of July, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 15th day of July, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

And in accordance with law, and an order of the Board of Trustees, made on the 8th day of May, 1865, so many shares of each parcel of said stock as may be necessary, will be sold, at the office of the Company, No. 611 Clay street, Room 8, on Monday, the 27th day of June, 1865, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

je10 W. L. KIRBY, Secretary.

Yankee Blade Tunnel and Colossal Silver Mining Companies, Reese River District, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Trustees of said Companies, held on the 1st day of June, 1865, an assessment of ten (10) cents per share was levied upon the capital stock of each of said Companies, payable immediately, in United States gold coin, to the Secretary, at his office, 305 Montgomery street.

Any stock upon which said assessment shall remain unpaid on the 1st day of July, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 20th day of July, 1865, to pay the delinquent assessment, together with the costs of advertising and expenses of the sale.

J. S. LUTY, Secretary.

305 Montgomery street.

San Francisco, June 1, 1865. je3

QUARTZ CRUSHER FOR GOLD HILL.—The Golden State Iron Works are just completing one of Hanscom's new crushers for Messrs. Butts Bros.' mill, near Gold Hill, Nevada. This class of mioing machinery for the reduction of ores seems to be gaining favor in the opinioo of many. Certain it is that great saving in time, power and machinery is bound to be made by the use of these rock breakers, by reducing quartz to a moderate fineness before passing it under the stamps.

GOING EAST.—Among the passengers which leave for New York by the steamer of to-day, is Dr. Jotham Newton, of the Newton Copper mine, of Amador. Dr. Newton, during his absence, will visit the Peonsylvania oil regions, and the mineral districts of North Carolina and Georgia. He will correspond with the PRESS during his absence, and our readers may expect to hear someth'ng of interest froot the mines of the Atlantic States.

ITEM FOR HUNTERS.—The price of refined petroleum per gallon, for the past five years, has been as follows; In 1861, 75 cents; in 1862, 35 cents; io 1863, 50 cents; in 1864, 55 cents; in 1865, 88 cents. The supply continues to increase, but not in a corresponding ratio with the demand.

REMOVAL!

R. WEGENER,

Accountant and Mining Secretary,

Has removed to

PETROLEUM

ASPHALTUM and COAL

AGENCY.

WM. H. TOBEY & CO.,

San Francisco,

Having completed their arrangements with parties in the East, as well as those on this Coast, are now prepared to enter into the purchase, sale or lease of

PETROLEUM, ASPHALTUM AND COAL LANDS,

—ALSO—

COPPER, GOLD AND SILVER MINES,

LIBERAL advancements made on CRUDE PETROLEUM and COPPER ORES. We are also prepared to supply all BORING APPARATUS, TUBING, STEAM ENGINES, BARRELS for shipping Oil, etc., of the latest and most approved patterns.

Experienced Artesian Well Borers and help furnished at the shortest notice.

Persons at a distance wishing to send orders, receive information or subscribe for stock, will save time and money by communicating with us, as we are in constant communication with the most reliable houses and experienced persons at the East.

Parties owning Oil Lands or knowing where there are good prospects, will do well to write or meet us at our office. All communications strictly confidential.

We have now on our Books descriptions of Oil Lands which were selected by experienced chemists. Companies will be organized and incorporated under the laws of the State of California.

Samples from all PETROLEUM and COAL MINES on the Pacific Coast are solicited for our Laboratory.

Best of references given.

☞ *All business connected with Petroleum and Coal Mines* will be promptly attended to. Address

W. H. TOBEY & CO., Box 2021 Post Office.

Office, Government House, corner of Washington and Sansome streets. 11v10

NOTICE.

The co-partnership heretofore existing between John Youngbery, Stephen H. Cevert and William B. Gleason, is hereby dissolved by reason of the said Gleason and Cevert having left for the East. This is to notify all persons that I shall pay no debts contracted by the said parties from and after this date. JOHN YOUNGBERY.

HELMBOLD'S

FLUID EXTRACT BUCHU

For Non-Retention or Incontinence of Urine, Inflammation or Ulceration of the Bladder or Kidneys, Diseases of the Prostrate Gland, Gravel, Brick Dust Deposits, Dropsical Swellings, Organic Weakness, Debility, Female Complaints, Etc.

H

HELMBOLD'S

FLUID EXTRACT BUCHU

—AND—

Improved Rose Wash

Will radically exterminate from the system Diseases arising from Habits of Dissipation, *at little expense, little or no change of diet, no inconvenience or exposure*; completely superseding those *unpleasant and dangerous remedies, Copaiba and Mercury*, in curing these diseases.

E

USE HEMBOLD'S

FLUID EXTRACT BUCHU

In all Diseases of the Urinary Organs, whether existing in MALE or FEMALE, *from whatever cause originating, and no matter of how long standing*. It is pleasant in its taste and odor, IMMEDIATE in action, and more strengthening than any of the preparations of *Bark or Iron*.

Those suffering from *Broken Down or Delicate Constitutions, procure the Remedy at once*.

The reader must be aware that however slight may be the attack of the above diseases, it is certain to affect his *Bodily Health, Mental Powers and Happiness*. If no treatment is submitted to, Consumption or Insanity may ensue.

All the above diseases require the aid of a diuretic.

Hembold's Extract Buchu

IS THE GREAT DIURETIC.

L

HELMBOLD'S

HIGHLY CONCENTRATED

Compound Fluid Extract Sarsaparilla,

For purifying the Blood, removing all diseases arising from excess and imprudence in life, chronic constitutional diseases arising from an impure state of the blood, and the only reliable and effectual known remedy for the cure of Scrofula, Scald Head, Salt Rheum, Pains and Swelling of the Bones, Ulcerations of the Throat and Legs, Blotches, Pimples on the Face, Tetter, Erysipelas, and all scaly eruptions of the skin, and beautifying the COMPLEXION.

M

NOT A FEW

Of the worst disorders that afflict mankind arise from the corruption that accumulates in the Blood. Of all the discoveries that have been made to purge it out, none can equal in effect HELMBOLD'S CONCENTRATED EXTRACT OF SARSAPARILLA. It cleanses and renovates the Blood, instills the vigor of health into the system, and purges out the humors which make disease. It stimulates the healthy functions of the body, and expels the disorders that grow and rankle in the Blood. Such a remedy, that could be relied on, has long been sought for, and now, for the first time, the public have one on which they can depend. Our space here does not admit of certificates to show its effects, but the trial of a single bottle will show to the sick that it has virtues surpassing anything they have ever taken.

B

Two tablespoonsful of the Extract of Sarsaparilla, added to a pint of water, is equal to the Lisbon Diet Drink, and one bottle is equal to a gallon of the Syrup of Sarsaparilla, for the decoction as usually made.

The above Extracts are prepared on purely scientific principles—in *Vacuo*—and embody the full strength of the ingredients entering into their composition. A ready and conclusive test will be a comparison of their properties with those set forth in the U. S. Dispensatory.

O

HOW TO USE THE REMEDIES.

In Diseases of the Blood, Humors on the Face, or any and every part of the body, use Extract of Sarsaparilla, applying to Pimples and all external Humors or Eruptions the Improved Rose Wash.

Use the Extract Buchu for all diseases requiring the aid of a diuretic, except those of the Urinary Organs, such as Gonorrhœa and Gleet; in these use the Extract Buchu, and inject with the Improved Rose Wash.

L

☞ THESE EXTRACTS HAVE BEEN ADMITTED TO USE IN THE UNITED STATES ARMY, and also are in very general use in all the STATE HOSPITALS AND PUBLIC INSTITUTIONS throughout the land, as well as in private practice, and are considered as invaluable remedies.

BALDNESS

Can be Cured!

MR. M. HOWARD, from Virginia City, Nevada, has discovered and patented an ENTIRELY ORIGINAL ARTICLE for producing a fresh, vigorous and permanent growth of the Hair upon the human scalp, where total or partial baldness has prevailed. His remedy is the assistant of Nature itself, enabling the Hair to penetrate the scalp and sustain its growth. It is simple and harmless in its application, but powerful in its good results, reproducing hair upon bald heads of long standing and preventing the hair from falling out. Mr. Howard will show interested parties calling upon him, at his room, No. 15, second door, a 522 Montgomery street, San Francisco, a long list of affidavits, containing positive recommendations of his RESTORATIVE from prominent residents of Virginia City who have been benefitted by its application. 17v10

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

That Reward.—In our issue of the 10th instant we noticed the fact that Mr. Webber, of the Montezuma Ledge, Humboldt County, Nevada, has offered a reward of $500 for a process which will extract seventy-five per cent. of the assay of silver from the ore of that ledge. We have been requested, by a gentleman of large metallurgical experience, to state through the columns of the Mining and Scientific Press, that if Mr. Webber will forward a few pounds of the rock—say ten or twelve—free of expense to this office, that the same will be subjected to a careful analysis at no other cost to the party sending, than the claim of the above reward in case of success in devising a process for working the ore within the percentage named. We can assure our Humboldt friend that the gentleman who will take the matter in hand is one every way qualified for the task. The sample sent should be carefully selected, so as to show all the characteristics of the ledge, and as near as may be an average of the same. It may be sent to our address.

The Stockton Seminary.—The third annual term of the school for young ladies, at Stockton, under the superintendence of Rev. A. S. Nicholson, D. D., will commence on the 1st of August next. The object of this school is to impart a thorough education in all the branches usually taught in seminaries of this description. The school is designed chiefly for young ladies although boys will be admitted as day scholars. The discipline of the institution is firm but mild, and the same watchful care will be bestowed upon boarding scholars, at all hours, which they would receive under the parental roof. The term is divided into two sessions of twenty weeks each. Further information may be obtained by addressing the principal, or the Rev. J. G. Gosman, Stockton.

St. Ignatius College.—The Annual Commencement of the St. Ignatius College, in this city, will take place on Wednesday next, commencing at 10 o'clock, A. M., and at 7½ o'clock P. M. Entrance on Jessie street, between Fourth and Fifth. Additional exercises will also be held on Friday evening, commencing at the same place and hour.

A man cannot burrow in his counting room for ten or twenty of the best years of his life, and come out as much of a man and as little of a mole, as he went in.

Eight thousand steam engines will be at work this summer in the Penasylvania oil region.

Light Reading.—T. S. Townsend, of New York, has completed an encylcopedia of the war, embracing fifty-three massive volumes.

Mining Summary.

CALIFORNIA.

Sierra.—The Downieville *Messenger* gives the following mining intelligence from Sierra county:

The Kanaka mine has been sold to P. A. Lamping, Esq. Mr. L. has transferred all his right, title and interest in the same to a New York company, who will at once commence operations for a thorough development of the mine.

Freeman & Baird, Bliss & Co., Friday, Baker, and in fact all other mining companies at Eureka, with one exception, have cleaned up their hundred or two pounds of gold, and their luck has exceeded their most fanciful expectations. Work is now over for the season with the hydraulic companies. The water has not lasted as long as was at first anticipated, but the time has been put in to good account, and everybody feels satisfied at the general result.

The famous Morning Star ledge, of Mr. Lawler, near American Hill, is a monster in proportions. It is twenty feet in width, and has been traced for several miles. Mr. Lawler has taken from his tunnel quite a pile of good looking rock. A mill has been projected for this claim.

The Ironsides mill is working, under the superintendence of Mr. Clark, with flattering prospects, and a clean-up will be made the latter part of June. The amalgam is looking well. This mill ran a short time last season, but owing to a scarcity of water, accomplished nothing.

The Sixty-ninth and Ohio companies are opening their claims as rapidly as possible, and the future has a prospect for this camp, which is decidedly promising from present appearances.

In Chip's Flat the Live Yankee has been undergoing repairs for several months and is now nearly ready for taking out the dirt. The companies at this point are all doing well, and getting large pay. There are about thirty men employed about these claims.

Carrigan & Hays' hydraulic claims have been doing well, and have a prospect of cleaning up richer than ever. The Mammoth Company are also doing splendidly. The Oak Flat Company are running their lower tunnel, and find the ledge prospects better as they go in, gold being frequently seen in the rock.

Plumas.—The following items are from the Quincy *Union*:

The copper smelting furnaces at Genesee Valley are now in full blast, and the superintendent thinks that he will be able to forward several tons of merchantable copper to San Francisco in the course of a couple of weeks.

Bidwell & Co.'s mill at Greenville, in this county, for a run of thirteen days during the month of April last, paid over $17,500, and it is only an eleven-stamp mill at that.

Shasta.—The new machinery for the Mammoth quartz mine has arrived at Red Bluff. The Mammoth is said to be one of the best mines in northern California.

The Highland Company have made an average clean-up for a two weeks' run, fully equaling former reports.

A correspondent of the Red Bluff *Independent* says that work has been suspended on many of the ledges about Copper City, for want of capital, although the owners still continue to have the utmost confidence in their value. The proprietors of Kelly & Peck's mill have nobly persevered during the long period of depression and general business stagnation, and have done much in furthering the development of our mineral wealth. They have four stamps working steadily, night and day, and crush over five tons of ore every twenty-four hours. The machinery of their mill is run by water-power. They are at present crushing Kellinger rock, which, I hear, pays well.

The same correspondent adds that silver rock was struck in large quantities, a few days since, in the tunnel branching from Pitt River tunnel into Kellinger Hill.

Butte.—The Blue Gravel Company, at Smartsville, according to the *Appeal*, have had another clean-up, realizing $50,768. This is the third clean-up since the 14th of March, the first being $46,000; the second $26,708, and the third as above, making in all, for three months, $123,576. The earnings of the company for the present year promise a much larger yield than the past year, when their net earnings were over $200,000. This, for a hydraulic claim, is probably unequalled in the State.

It is stated that since the discovery of the old or a new ledge in the Jefferson claim, at Brown's Valley, the stock has stiffened up wonderfully.

Rich gravel diggings have just been discovered in the main street of the town of Brown's Valley. Several pieces of gold, valued as high as $60, have been taken out.

Nevada.—The *Transcript* is informed that the Union Quartz Ledge has passed into the hands of a New York company, Mr. Forbes, as agent, having made the purchase. The price paid was $36,000. The agent is also negotiating for the purchase of the Sneath & Clay mill and mine, and we understand the amount offered is $30,000. The Union Ledge is one of the recent discoveries.

The quartz ledges discovered in Willow Valley, some three months ago, are beginning to yield large amounts of gold. The first of the ledges recently opened is named Talbot, and the Burrington company is the only one upon the ledge from which a crushing has been had. The last rock worked was a lot of fifty tons, crushed at the Merchie mill, on Little Deer creek. After four days' run, with four stamps, the company cleaned up the snug little sum of $2,600. Quite a number of other locations have been made, the owners of which are pushing forward the work of development with commendable energy.

A notice of some gravel claims of extraordinary richness, near Washington, will be found in our editorial columns.

The Eureka mill, at Grass Valley, according to the *National*, is constantly at work, yielding proceeds perfectly fabulous. It is no extraordinary thing for the owners to deposit, after a week's work, two hundred pounds of amalgam. It is reported that a half million dollars were offered for the Eureka mine by parties below, and refused. They are down two hundred feet and are sinking for a hundred feet more. They will finish this work in the course of three or four months.

Messrs. McLaughlin & Loutsenheizer, the owners of the Hartery mine, a short distance below Grass Valley, are putting up machinery on the same, which will be ready for operation by the last of July. The machinery has been prepared at the Marysville foundry.

A number of rich gold-bearing ledges have been discovered in the extensive eastern portion of this county, and near the summit, on the Henness Pass route. Prospecting lots of rock have been taken to Nevada City for testing in the mills there. It is expected that arrangements will soon be made for erecting mills near these ledges.

Some very rich placer diggings have also been discovered on the summit, four miles north of the Truckee, and near the Downieville road. One man took out $83, the result of one week's sluicing.

Calaveras.—The Copperopolis *Courier* says that the shaft on the Index copper mine (a supposed extension of the celebrated Union), is now down thirty-five feet, with good indications. The work of developing this mine will be pushed forward with vigor.

During the week ending June 15th, the Keystone company shipped from their mine, in this place, eighty-three tons of first-class ore, or 166,000 pounds.

The shipments of ore from the Union mine, during the month ending Thursday last, averaged 108 tons per day, including Sundays. The shipments one day went as high as 151 tons.

ESMERALDA.

We gather the following from the Esmeralda *Union*:

A few weeks since our people were crazy with the Reese River fever, and were going off in swarms. The current now appears to have turned, and miners, prospectors and speculators are arriving here with the stage, on horseback and by every other means of conveyance, in greater numbers than they went away a short time ago. Mines of wonderful richness are being developed throughout this section of the State, and must soon attract a large permanent population. Within the last two weeks the prospects of this district especially have improved, and we shall not be surprised to see times as good here in a few weeks as they have ever been before.

There is a prospect of having good times soon at Bodie. Most of the mining companies there are preparing to work their claims on a large scale the present summer.

A very rich series of ledges is reported to have been discovered some sixty-five miles east of Aurora, and a party of prospectors have started out to go into the development of the new mines, fully supplied with provisions, tools, etc.

Mr. T. A. Garland, in connection with several other citizens of Aurora, is organizing a company to sink a shaft 400 feet deep in Esmeralda gulch, from which they intend to run drifts to explore, at a great depth, the Esmeralda, Winnemucca and other mines on Silver and Middle hills. The two lodes named are considered the backbone of the district.

Favorable reports still continue to come in from the new Kearsarge discovery in the Owens River district. About 3,000 lbs. of ore from there recently arrived at Gold Hill, to be worked as a test. The *News* thinks it will prove very rich. It is rated as second-class ore, and is thought to be worth about $130 per ton.

Fine Copper Specimens.—A lot of very fine specimens of copper ore has been laid upon our table from the Mount Ararat and Mammoth copper mines, near Taylorsville, Plumas county. The specimens consist of the peacock ore, yellow sulphurets and black oxyds. The copper ores of that region are among the richest in the State, and the veins are massive and highly metalliferous. The specimens were forwarded by Dr. H. T. Lee to R. B. Gray, of this city. When proper facilities for transportation are opened up Plumas will be found one of the richest mining counties in the State.

The Brown's Valley Mines.—A renewed interest appears to be felt with regard to the Brown's Valley mines, in consequence of some recent favorable developments in that quarter. It appears that a rich streak has been found in the Jefferson mine, running in a southeasterly direction, towards the Pacific and Daniel Webster claims. This is evidently what was predicted a long time since, by Captain Williams, our late Brown's Valley Correspondent.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

THE AGE OF GOLD-BEARING ROCKS.

BY THOMAS ROWLANDSON, FELLOW OF THE GEOLOGICAL SOCIETY, LONDON.

NUMBER FIVE.

WHAT IS THE AGE OF THE CALIFORNIA AURIFEROUS AND ARGENTIFEROUS BEARING ROCK?

It has been noticed that Professor Whitney, while in California, professed a most rigid deference to that part of the law establishing a State geological survey, which was inserted principally for the purpose of prohibiting the holder of the office from making use of the information gathered, at the State's expense, for purposes of private emolument, by private publication, and partly under the impression that the doing so would tend to diminish any supposed profit to be derived therefrom when finally published by the State, which problematical profit was to be applied to the State School Fund.

That a paid State servant should be prohibited from making use of information obtained at the State's expense, and applying time paid for by it in getting up publications, in place of using that time in the State's service, is only a reasonable precaution; but it never could have been contemplated by the framers of that clause that such a reasonable prohibition would be tortured into a refusal to afford all useful information, during the course of the survey, to those most interested, when sought for by them, namely, the citizens of California, who employed and paid him. On this subject I shall, after the conclusion of the present series, make some additional remarks under another caption.

It would appear, however, that since Prof. Whitney left the shores of California he has felt his pen and tongue more at liberty;* for we find that he had only been a few months at the East when there appeared an article in the number of *Silliman's Journal* for September last, from Professor Whitney, forming something like a *resume* of the chief results ascertained in the course of the survey, in which, by the way, Professor W. makes the remark that—

"The first volume to be issued will comprise the first installment of the Paleontology of the State. It will be illustrated by thirty-two crowded plates, on steel and stone, which have been *for some time* in the hands of the engravers, and of which the accompanying text is *now passing rapidly through the press.*"

In a foot note to the above, the State Geologist observes:

"As the engraving of the plates will still require some time, the letter-press, *which will soon be completed*, will be issued by itself, in a limited number of copies, to which the plates will be added on their appearance."

The reader's attention is requested to the italicised passages, and needs only to be called thereto in order to feel satisfied that some circumstance which requires explanation must have occurred in order to account for the fact that no publication has taken place up to the middle of May of a work stated on the first of August last *to be then rapidly going through the press.* In the course of the present paper I shall allude to many points where it was, and is still, of some economic importance to the citizens generally that they should have been put into the earliest possible possession of many of the promised and anticipated facts. In addition to the above, the State Geologist, in the same communication, stated:

"Immediately after the appearance of the first volume above mentioned, a second will be put to press, which will be devoted to the general geology of California. This volume, it is hoped, may be issued early in the next year."

Why, it may be asked, in heaven's name, has a letter-press work, said to be rapidly going through the press in September last, and a second (which would be the most interesting one to the general reader), whose appearance was promised early in the current year, have not made their appearance up to the latest news from the East.

The passages, however, which chiefly relate to the subject under consideration, and which will undoubtedly prove of the greatest economic importance when fully worked out, and which will most probably give rise to the greatest amount of discussion amongst geologists generally, are the following:

"Perhaps the most striking result of the survey is the proof we have obtained of the immense development on the Pacific side of our continent, of rocks equivalent in age to the Upper Trias of the Alps, and paleontologically closely allied to the limestones of Haltstadt and Ausee and the Saint Cassian beds, that extremely important and highly fossiliferous division of the Alpine Trias.

"This great Triassic belt of the Pacific coast has been most fully explored by the survey in the latitude of 40°, and over a width, east and west, of nearly four degrees of longitude (117° to 121°). It is from this region that the largest portion of the fossils have been obtained, both from the three parallel ranges in longitude 117° to 118°, called the Humboldt ranges, and from localities in Plumas county, California. But sufficient paleontological evidence has been obtained to enable us to state that this formation extends from Mexico to British Columbia, occupying a vast area much broken up, interrupted, and covered by volcanic and eruptive rocks, and usually highly metamorphosed.

"Among the specimens from the Humboldt and Plumas county, Mr. Gabb recognizes at least four species as identical with European, while the whole facies of the collection is most strikingly like that of the Halstadt beds—the same intermixture of orthoceratites, ceratites, goniatites, nautili and ammonites, the latter frequently of those globose forms occurring in the Alps together with *halobia, monotes, avicula, pecten*, etc., a *monotis* being the most widely diffused and the most abundant of all.

"Accompanying the Triassic formation in the Sierra Nevada, and probably also in the Humboldt ranges, is an extensive development of jurassic rocks, usually highly metamorphosed and extremely barren of fossils. Enough, however, have been found to justify the assertion that the sedimentary portion of the great metalliferous belt of the Pacific coast of North America is chiefly made up of rocks of jurassic and triassic age, with a comparatively small development of carboniferous limestone, and that these two formations are so folded together, broken up and metamorphosed in the great chain of the Sierra Nevada, that it will be an immense labor, if indeed possible at all, to unravel its detailed structure. While we are justified in saying that *a large portion of the auriferous rocks of California consist of metamorphic, triassic and jurassic strata*, we have not a particle of evidence to uphold the theory that has been so often maintained, that all, or even a portion, of the auriferous slates are older than the carboniferous—not a trace of Devonian or Silurian fossil ever having been discovered in California, or indeed anywhere to the west of the 116th meridian. On the other hand, we are able to state, referring to the theory of the occurrence of gold being chiefly limited to silurian rocks, that this metal occurs in no inconsiderable quantity in metamorphic rocks belonging as high up in the series as the cretaceous."

With reference to the statement respecting the analogy between the Triassic group of rocks on the Pacific coast and the Haltstadt beds of the Alps, judgment will have to be suspended until an opportunity is afforded of examining the evidence on which it is based. One statement appears to me rather remarkable, namely: that respecting the occurrence of goniatites in the beds alluded to. My opportunities of ascertaining what has been doing in European paleontology have been limited since I left that continent; but up to that period, and subsequently, I have received no evidence of goniatites being found higher than the carboniferous or mountain limestone of that part of the world, nor have I ever seen it mentioned that goniatites have been found as yet in the Haltstadt beds, and as these for a long period were considered a geological anomaly as respects the organic remains found therein, a brief description of them will not be out of place. The Haltstadt beds occupy a fixed calcareous zone along the entire line of the Alps, from Hoornstein to the Tyrol. The discovery of numerous fossils and their careful examination have shown that this formation contains a very remarkable fauna, peculiar to itself, exclusively Alpine (unless the researches in California exhibit, as asserted by Prof. Whitney, analogous forms), and of which hitherto no one species can be identified with non-alpine forms, although several show a great resemblance to forms which in other parts of Europe are characteristic of palæozoic and jurassic formations—a fact the more remarkable as both in the beds above, as well as those below, forms occur which are identical with non-alpine forms. Another feature of the Haltstadt fauna is, that the most typical species show a great resemblance partly to palæozoic and partly to jurassic forms; thus the genus *halopello, loxomena* and *porcellia* are related to the former, whilst the species *phasianella, turbo, neritopsis, pleurotomaria, cirrus* and *lima* have a jurassic type. Although the fossil evidence of these beds does not satisfactorily identify them with any non-alpine formations, stratigraphical investigations have shown that they must be considered as the equivalent of the upper trias beds of the rest of Europe—the kenper of Germany; the upper new, red sandstone of England. This very interesting subject will no doubt occupy a large share of attention by European geologists, as the Halstadt and St. Cascian beds for a long time were considered geological enigmas, and it will be fortunate for science if it is found on further investigation, that their analogue has been found in a somewhat similarly elevated region, divided from the Alps by nearly half the globe. I am strongly inclined to believe that future and more minute investigations will develop a very strong parallelism not only between the Haltstadt beds and the trias region of the Sierra Nevada, but also a great similarity to the auriferous districts of the Tyrol, Northern Italy (contiguous to where the Appenines diverge from the Alps proper), part of Hungary, and possibly the whole of the metalliferous district of Transylvania. The proximity of petroleum springs, which are found in the surrounding tertiary formations in all the countries named, strengthen the probabilities of a striking similarity pervading the American and European beds.

In connection with this interesting subject, I may here mention that I recently received from a relative in England some copies of the Ulverston *Advertiser*, which contained a series of very interesting articles connected with the geology of the neighborhood of North Lancashire, by Mr. John Bolton, who is evidently an acute and accurate observer, from which I gather that it is not improbable that a section drawn across that part of England, extending from the westerly portion of Lower Furness, in an easterly direction, to the German Ocean, would, in several parts of the line, exhibit a strong parallelism with the Haltstadt beds and the asserted similar ones of the Pacific slope of the United States.

Mr. Bolton states that "on the west side of the Park at Holker, the seat of the Duke of Devonshire, there is a most instructive natural section of rock, which shows the junction of mountain limestone and the lower new, red sandstone, some parts of which abound with fossils characteristic of the coal formation." The particulars of this section Mr. Bolton has promised to describe at some future period, which the writer has not yet seen if published. It is not very surprising to find it stated that fossils indicative of the coal measures are found in the lowest bed of the trias (the bunter-sandstein of Germany) immediately overlying the carboniferous limestone, when it is mentioned that only a few miles therefrom, on the borders of Lancashire and Yorkshire, a bed of coal has long been worked in this limestone. A question arises, however: Is it right to assume as certainly established that the sandstone beds here alluded to are those belonging to the lowest member of the trias or new red sandstone series? May they not be permian sandstones, as these have now been traced as skirting the carboniferous formation on the border country of England and Scotland? As a copy of this will be sent to England with the object of being forwarded to Mr. Bolton, I hope that gentleman will favor the world with a few more particulars on this interesting subject. The preceding remark is merely inserted as a suggestive doubt, my own opinion leading me to infer that on further enquiry the fact as laid down by Mr. B. will be fully established, which, if it eventually proves to be the case, will most probably at an early day lead to a satisfactory elucidation of what has long been deemed a geological enigma. Auriferous bearing veins are found not only in the adjoining county of Westmoreland, contiguous to the district under notice, but notably so within a few miles, distance probably fifteen, in the same county, namely, at the Coniston copper mines, every sample of which assayed by the writer was found to contain gold from eight to ten dwts. per ton, or fully up to the average of many gold mines worked in various parts of the world, and greatly beyond the amount found in the Tyrolese auriferous veins which lie contiguous to the Haltstadt beds.

*Perhaps as profound a piece of humbuggery as ever was committed on a credulous public, was that of insisting on the necessity of Professor Whitney going East in order to publish works relating to the survey. The first volume was promised in April; but has not yet appeared. In the meantime, the Geologist's handsome salary is going on, but to practical purposes the survey is at a stand, or nearly so.

Markleeville Correspondence.

Our Markleeville correspondent sends us a very excellent and well written account of a visit to Carson Peak, one of the loftiest and most conspicuous mountain summits in that part of the State. We have reserved his account of that trip to follow our description of the Geysers, but give to-day the concluding portion of his letter, evidently written after his descent from the clouds and noticing the progress of the mining interest around Markleeville. He writes:

At this season of the year our mountains have put on their wedding garments and are clothed in all the beauties of Spring, for from mountain top to vallies low vegetation is out, and the wild flowers are seen over hill and dale, on every hand, as far as the eye can see. The mountain streams are roaring and plunging with the waters from melting snows, and their angry waves hiss and boil and plunge with frantic struggles amid the huge boulders in the river beds, then lashing the rock-bound shores, pass on in endless torture. Our mines are also being worked with more energy than the outside world would suppose when the financial condition of the country does not grow better. In the region of Silver Mountain several mines are being pushed ahead. The Mountain company have lately struck a blind ledge in their tunnel several feet wide, and the rock is said to be rich. The I X L company are driving two tunnels, with pay ore in one of them. The Buckeye and Lady Franklin have also resumed work. In Monitor district, the Monitor Consolidated and Winchester companies are driving ahead with their bed-rock tunnels. The Morning Star, of Mogul, is also at work, and are preparing to sink a mammoth shaft. The Good Hope company, in Alpine, are going ahead like faithful soldiers, and although they have been following the ledge some two hundred feet, the ground overhead has been broken, and in the course of another hundred feet the tunnel will reach a hill, where paying ore is expected to be found. The company have also been sinking an air shaft, which is just now completed, and the mine will be supplied with an abundance of pure air. The walls of the ledge in this claim are well defined and cased with a beautiful blue mud, while the quartz looks exceedingly well. The times are very hard here, but we all believe the country will be rich when once developed. "We may be happy yet."

SIRROM.

Markleeville, Alpine county, June 15, '65.

Our Traveling Agent, Mr. R. Lattimore, is meeting with encouraging success in the lower counties. Our thanks are due to our cotemporaries of the *Ledger* and *Union Advocate*, of Jackson, Amador county, for their friendly notices, which we append:—

The Mining Press.—R. Lattimore, Esq., agent for the Mining and Scientific Press, has made us a friendly call, and proposes to visit the various mining districts of our county in a few days. It affords us great pleasure to recommend such a journal as the Press to the favorable notice of all our friends in any way interested in mining interests, as it is the best of the kind published on the Pacific coast, or elsewhere. No miner would be without it if he knew its value to him.—*Amador Ledger.*

Mr. R. Lattimore, the traveling agent of the Mining and Scientific Press, has arrived in this place and intends visiting the different towns in our county. The Press is issued weekly by Messrs. Dewey & Co., San Francisco, and is replete with useful information and is a paper which we believe should be in the hands of every miner, millman and business man on this coast. We wish Mr. Lattimore the greatest success.—*Jackson Union Advocate.*

Big Loads.—The big quartz wagon, of which we spoke some weeks since, as in progress of construction at Dayton, Nevada, has been completed, and is now making regular trips between Dayton and Gold Hill, in the quartz and wood trade. The wagon recently carried 19,470 pounds of quartz from Gold Hill, and on a subsequent day took 20,950 pounds. The commander says he will haul eleven tons, if the mine ever gets that much on the dump at one time.

Immense Strawberry.—The editor of the Nevada *Gazette* has seen a strawberry of the Chilean variety, raised in the garden of Mr. George Keeney, of Nevada, which measured in circumference, by a surveyor's tape line, within a small fraction of seven inches. The fruit was somewhat flattened latitudinally, which caused it to measure rather more than if it had been round.

THE GEYSER SPRINGS OF CALIFORNIA.

Our next visit carried us up the Pluton, on the left or northern bank, past the "Ovens," deep growling with subterranean utterance, and hot with the escaping steam, to the "Eye Water Boiling Spring," celebrated for its remedial effects upon all manner of inflamed and weak eyes. Quite close to it is a very concentrated alum spring, with a temperature of 73.°5—it will set your teeth to a keener edge than a well-ground axe. Higher up we came to a peculiarly sweetish iron and soda spring; in extent it is about fifteen feet by eight, and two feet deep; only twelve feet above it is the "Cold Soda and Iron Spring," incrusted with iron, and the bottom with a deposit of soda. This is the finest and best we have yet tried; strong, tonic and inviting. The temperature was only 56°, even with the sun shining upon a part of it. It is about twelve feet by five, and affords a large supply. Not one in a hundred visitors come up this far, or, coming, never notice its value. About three-quarters of a mile up the Pluton, from the hotel—far past the old saw-mill—is the "Great White Sulphur," over forty feet by ten, and four or five feet deep. This spring could readily be made of any size, as the supply is equal to a small stream. The waters bubble with the escaping gas at every point; every rock is incrusted, and the bottom has a deposit of several inches thick. The temperature is 67°, with the sun shining in full blaze upon it. The Pluton, in the shade, was 61°. The air is so impregnated with its sulphurous fumes, that you readily detect it from a distance of several hundred yards, through all the intervening windings, rocks and interlacing trees. The rocks, for over half a mile down the stream, are incrusted with the deposits. Along this stretch of the Pluton are many fine pools for bathing, and above for trout fishing.

The "Indian Springs" are nearly a mile down the cañon below the hotel, and issue from the northern side. The boiling water comes out clear as ice, deposits a black sediment, and is incrusted with a thick white sulphurous substance. This is the old medicated spring, rarely seen by visitors, but where many a poor aborigine has been carried over the mountains to have the disease driven out of him by these powerful waters. Here remains their bath, built of stone, six feet in extent and two or three feet deep, in which they laid the sick, whilst by its outer wall runs a cold stream of pure water having a temperature of 66°, and another of water impregnated with iron and alum, and 68°.5. These could be let into the sulphur bath to graduate the temperature. It is beautifully and romantically situated; well protected by steep banks and overhanging trees from the sun, and forms a delightful place. On the wild oat covered mound above it, are the remains of the hospital for the Indian patients.

But we must close—deferring the account of our trip up the north ridge of the Pluton to view Clear Lake—and say emphatically that we have never enjoyed ourselves better, nor felt in finer trim. Chalybeate and sulphur waters, red, white and black, for drinking and bathing, have knocked rheumatism and neuralgia into fits, and our medico is death on them.

Captain Davidson concludes thus: "Here are enough mineral springs to give revenue to all the Landgraviates, Duchies, Principalities and Kingdoms of the whole thirty or forty German States. No such thing exists elsewhere on the Pacific; the hot white sulphur of Santa Barbara is as nothing to it.

"We have not mentioned a tithe of those you pass at every step in your explorations—nor one day, nor one week will reveal them all to the enquirer. Do not suppose desolation, fire and brimstone reign supreme—one of the wonders of the place is that grass, shrubs, and huge trees, should grow on its very edge and even overhanging, in many places, the seething cauldrons below. The most varied wood abound around you, oaks, stately pines, sycamores, willow, alder and madrone. The scenery, says Bayard Taylor, is finer than that of the lower Alps, and the Geysers is a mine of future wealth, and are unapproachable means of thorough regeneration."

Another visitor in 1861, remarks: "The sight of the Geysers troubled me, I could not comprehend them, and moreover the conviction accompanies their sight, that they never can be understood. We have in the canon, underground roarings and loud bellowings with the strength and fury of a thousand steam engines. The mighty mysterious force below drives black water to ghastly orifices, wherein it boils and surges furiously and fearfully. In the Witches' Cauldron this execrable compound, hotter than boiling water, having broken the glass of a thermometer, uprises a couple of feet, and falls in a weird-like stream. It is unfathomable, and though its level continually varies, the water never runs out."

Innumerable are the smaller springs in the ravine, with similiar characteristics: the waters gush from the hill sides, filling little reservoirs, hollowed by its own force, and runs back to be expelled. In one spot there are three springs within as many feet, one contains alum, the next iron, the third deposits white sulphur. Where some springs have been, are now small chambers, whose sides, floors and ceilings are incrusted with salts, sulphur and acids of the most varied and charming colors. Thus may be seen sulphur, yellow and white in glistening crystals, white alum, green copperas, blue cobalt, interminglied in fantastic forms, draping and carpeting these fairy grottoes. It is impossible in any word painting to convey an idea of the view of the Geyser cañon, which the eye can almost take in from a high rock at its head. It is all color, and of all colors. If you can fancy a valley about a fourth of a mile long in whose bosom a hot spring leaps from rock to rock, whose precipitous sides have been bared of all vegetation, and heated to a white heat, until stone, hard as granite, has become a mass of ashes, and can imagine giants a hundred feet high with tartarean ladles proportioned to their hight, pouring streams of chemical substances in solution upon the hissing rock, and can suppose that at the same time other mighty ones beneath the earth are piercing its crust with tridents and breathing sulphurous fumes of unbearable heat to mortal frames, through those apertures, you may faintly conceive the appearances presented by this unique and remarkable valley. One hollow looks like the filled up crater of a volcano and on striking the ground, the reverberation sounds as from an unfathomable abyss below. The sides of this crater, so to term it, forms the mountain of firs, for, it is said, that during the night a phosphorescent flame hovers over them. Not far from the mountain is another hollow, and upon a huge boulder is an uncouth stony figure, said to have been badly sculptured by an Indian. It was to have been his idol, but he never returned to his tribe, and his people say, that he was carried away by the spirit of the place, therefore they cannot be induced to visit the cañon. One of their priests occasionally visits a hollow rock beside the hot stream; there he is supposed to commune with the spirit of the same, bringing oracles to guide his auditory, as the Indians refuse otherwise to visit the cañon. About a mile from the cañon, down the Pluton, are some boiling sulphur springs to which the Indians are more favorably disposed. Here they have formed a circular bath, in which boiling sulphurous water flows, as in a reservoir. Close by it, under the shadow of a large rock and shade trees, flows an icy cold, limpid streamlet. To this place the Indians make annual pilgrimages in search of health and to dissipate rheumatic affections. Their method is to strip the patient, then wrap him or her in blankets, and stretched on a rude frame, hold it over the sulphurous steam that is discharged either from the hot stream or exuding from the ground. After an exposure of fifteen minutes the patient is dipped into the cold stream, and by a few repetitions of this process a cure is effected.

So far as is known, there is no other spot on earth, save Iceland alone, an island whose name alone denotes the inhospitality of its clime, and a region that will rarely be sought by the tourist where such physical wonders exist. The traveler should come here to add another to the catalogue of the glorious and inexplicable wonders of the Great Supreme, affording a lesson to value all the more the valleys with verdure clad, by the exhibition of that seathing power which might have made of hill and valley a universal horror-giving scene of desolation, such as astronomers lead us to believe is presented by our satellite. The man of science should visit here to see nature work in her laboratory, to test her samples, and to attempt the unfolding of an enigma greater than that which puzzled Œdipus.

[To be Continued.]

Shaft Broken.—One of the main shafts of the Gould & Curry Mill broke on Saturday last, stopping the whole concern. It was cast iron, six inches in diameter. It was soon replaced, however, and everything is now moving on as usual.

The Problem of Gold and Silver Extraction—A General Review—No. XII.

BY PROF. L. LANSZWEERT.

We now come to the principles on which metallurgic processes are based, and the practical application of these principles. Mechanical and chemical sciences are here involved—the former to effect a due combination of the extracted ore from foreign impurities, and the latter to complete this separation and evolve the metal in a condition as near that of absolute purity as may be possible or desirable. The mechanical part of metallurgy can only be discussed advantageously hereafter; in this review, therefore, I shall, for the present, limit myself to an exposition of the chemical principles of metallurgic operations.

Between abstract chemistry, if the term be allowable, and technical chemistry, there seems a wide difference at a first glance. The only real distinction between them, however, will be found to be one of degree. The principles are the same, and both are amenable to the same laws; the laboratory chemist, however, having more agents at his command—being little amenable to considerations of profit—more readily carries these indications to their several finalities.

The chemical part of metallurgy has for its object the separation of various substances, and the isolation of a few, by the operation of chemical affinities; being thus amenable to the ordinary rules of chemical guidance, the first of which is based upon the law that chemical action takes place (with a few exceptions, and those doubtful), between portions of matter the cohesion of which is slight. Reversing the proposition, we may also say that chemical decomposition is effected by loosening the state of cohesive affinity.

Of the three forms in which matter is found, namely, the solid, the fluid and the gaseous state, respectively, it is evident that the two latter are most under the control of cohesion. Gases, indeed, are often said to be absolutely devoid of cohesion, as between their particles; a proposition which, though chemically unsound, may be considered to be practically correct.

The metallurgist, then, in effecting his numerous decompositions, proceeds to diminish the cohesive force by which the particles of his material are held together. He begins by mechanical processes—by hammering, grinding, stamping, etc. When these can go no further, he has recourse to chemical means. The problem now is to liquify, or to gasify—usually the former, though many important mineralogical operations involve the production of gas, or at least of vapor—for gases and vapors may be generally regarded as identical. Supposing liquifaction to be the object in view, the metallurgist has the choice, theoretically, of dissolving his substance in chemical menstrua or of fusing it by heat. The former alternative is superior in the correctness of its results, and for that reason is usually adopted by the laboratory chemist; but it is so expensive and slow, and inapplicable, where large masses are concerned, that it is never adopted by the metallurgist otherwise than by necessity. With the exception of platinum and its associates—all worked exclusively by the process of solution in chemical menstrua, by the moist process, in point of fact—gold and silver occasionally, and a few of the common metals under certain peculiar conditions, the moist process of effecting solution of cohesiveness may be regarded as beyond the pale of applied metallurgy.

We have thus limited the metallurgist to the agency of fire; and we assumed, as is most usual, that the object of furnace heat shall be to reduce the material to the condition of fluidity. We might, therefore, at once, pursuing the thread of demonstration, enter upon the theory and operation of fluxes, were it not that a care of effecting chemical decomposition by the formation of gas or vapor sometimes precedes, and therefore claims precedence in our remarks.

Many ores either contain substances naturally volatile, or which generate, under the combined influence of heat and air, volatile combinations. Sulphur and arsenic are prominent examples of this kind, and serve well to illustrate that application of a chemical law is evolved in the metallurgic process of roasting or calcination, respecting which sufficient particulars have already been given in an earlier part of this review.

The process of roasting is variously modified, to accord with the peculiarities of certain metals, or to gain the precise end desired. In some cases it is no more than the process known to chemists as dry distillation; in other cases its success depends on the combined agency of an atmospheric current, as applied, for instance, to the evolution of antimony. Though the metallurgic operation of roasting involves a well marked case of gasefaction applied to a different end, yet similar results are obtained under different forms of apparatus. The operations involved in the production of mercury and zinc are familiar examples. Both these metals are remarkable for their extreme volatility, the first especially so; hence the process of metallurgy adopted in their production is not one of smelting, properly so called, or of roasting, as popularly understood; but as one of veritable distillation. Mercury is frequently produced by simple sublimation, without the addition of flux or coal. So also is arsenic; but in most instances lime, carbon and such other substances as decompose the ore, are added.

[To be continued.]

"Gold in the Sacramento."—In our item under this head, last week, we inadvertently attributed the experiments to which we alluded to Mr. Salmon; the credit should have been given to Mr. H. L. Hopkins, the inventor of the "Little Giant" amalgamator.

Mr. William Emery writes us from Soaora, Tuolumne county, with reference to the above experiments, as follows: "I have for several years held to the belief that the beds of the American and lower Sacramento rivers—with properly adapted facilities—can be worked with greater profit than the celebrated Comstock ledge. Some years ago I broached this matter to a moneyed man, who scouted the idea as utopian; and several times since I have casually mentioned it, only to be sneered at. I am confident that a few years only will elapse before the feasibility of the scheme will be fully demonstrated; and so much has it engaged my attention, that I have experimented upon river sand with about the same results as you give, and have also devised a plan by which sand can be raised from a depth of from fifteen to twenty-five feet below the bed of the river. The capital requisite to put such means into operation is comparatively small, and if a company should be formed and worked with vim, they would be astonished by dividends the first month after commencing active operations. I trust more will be said about the matter, and further tests made, for I am assured in my own mind that the choicest diggings in the State are those river beds."

Causes of Sudden Death.—Very few of the sudden deaths which are said to arise from diseases of the heart, do really arise from that cause. To ascertain the real origin of sudden deaths, the experiment has been tried in Europe, and reported to the scientific congress held at Strasburg. Sixty-six cases of sudden death were made the subject of a thorough *post mortem* examination. In these cases, only two were found that had died from disease of the heart. Nine out of sixty-six died from apoplexy, while there were forty-six cases of congestion of the lungs—that is, the lungs were so full of blood they could not work, there not being room enough for a sufficient quantity of air to enter to support life. The causes that produce congestion of the lungs, are: cold feet, tight clothing, costive bowels, sitting still until chilled after being warmed with labor or a rapid walk; going too suddenly from a close-heated room into the cold air, especially after speaking, and sudden depressive news operating on the blood. These causes of sudden deaths being known, an avoidance of them may serve to lengthen our valuable lives, and which would otherwise be lost, under the verdict of heart complaint. That disease is supposed to be inevitable, hence men may not take the pains they would to avoid sudden death, if they knew it lay in their power.

The Son's Tribute.—Three sons of an Eastern lady were invited to furnish her with an expression of their love before she went on a long journey. One brought a marble tablet, with the inscription of her name; another presented her with a rich garland of fragrant flowers; the third entered her presence, and thus accosted her: "Mother, I have neither marble tablet nor fragrant nosegay, but I have a heart; here your name is engraved, here your memory is precious, and this heart, full of affection, will follow you wherever you travel, and remain with you wherever you repose.

Since Secretary Seward's accident disabled him, Senator Sumner has been assisting in conducting the Department of State, and has prepared much of the important correspondence

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

SAN FRANCISCO, SATURDAY MORNING, June 24, 1865.

Capital is still in ample supply for all the legitimate demands of the season, and the bank rate shows no variation—1½ ₱ cent. per month being the prevailing figure. Out-door negotiations may be quoted at 2@3 ₱ cent., where parties are less favorably known, or in more need and consequently more helpless in the hands of the money lender. The mercantile classes are requiring about the ordinary aid, which is readily obtained, and so far as we can learn, interior collections and outstanding obligations are realized with the usual facility and promptitude. Loans upon mining stocks are still made with hesitancy, and considerable distrust is evinced by capitalists as to the future of some claims. The effect of this upon the stock market has been depressing, but healthful for the mining interest, by checking purely speculative operations and directing attention more closely to the actual condition and merits of the different companies.

In financial and commercial circles, the movements of certain politicians, in this city and elsewhere, respecting currency matters, excites some remark, but no special anxiety. The fear that Legal Tenders, or any other paper money, not redeemable in gold, can be made to circulate here as currency, is scarcely entertained. The unanimity of opposition to it is remarkable, for the simple reason that our present metallic currency is more staple, safe, and better every way, and that no necessity for changing it exists here, as was the case at the East. Were the change of any material importance to the Government, or could it result beneficially to any interest on this coast, business men would probably offer no objection. If individuals are adventurous enough to attempt the establishment of a National Bank here, under the laws of Congress, with no other foundation than paper issues for the redemption of its liabilities, though there are doubtless many who would be willing to be subsidized by such an institution, and favor it with open mouth and empty pocket, there are but few among business men who would have any confidence in its stability, profitableness or usefulness.

Receipts of treasure from the interior mining districts, since Saturday last, amounted to $1,200,000, making an aggregate of $4,000,000 during the current month. Gold bars are selling at 825@830, and silver at from par to 2 ₱ cent. discount.

Legal Tender Notes have been more active, and $150,000 were dealt in, receding from 74c to 71½c, rallying to 74¾c, then selling at 74c @74¼c, and closing at about 74c bid. Latest telegraphic advices from the East quote gold at 139 on the 20th inst.

The mining share market has been somewhat irregular and variable since Monday last, but for the most part nearly all stocks are stronger, and have been dealt in at higher prices than at the close of last week. No important developments have been made this week in leading mines, but certain indications were met with of sufficient encouragement to induce a little speculation in some stocks and to give more strength to others. Notwithstanding the losses sustained in the depreciation of all shares a short time since, the public seem to be eager to enter the market again upon the least evidence of improvement in the appearance of any portion of the Comstock lode, at the depths now attained. At no former period have explorations been carried on with as much vigor and energy as at this time, and future developments will be watched with great interest.

Gould & Curry advanced from $1,650 to $1,825, seller 30, then sold at $1,800, and closed at $1,850 bid. There is nothing especially new to report from this claim, and the late rise is owing probably to the scarcity of the stock in thie market, the presence of some Eastern orders to buy, and the recent favorable indications met with in the Savage mine.

Savage was in decided request early in the week, suddenly advancing from $1.175, seller 30, to $1.700 cash; then receding to $1,425, rallying to $1,520, dropping to $1,450, seller 30, and selling yesterday at $1,490@1,500. Within this range 109 feet were sold. In drifting east and then running north from the shaft sunk into the fifth level, a small body of ore has been disclosed, which it is thought may be a continuation of the northwest deposit in the fourth level above. If this should prove to be so, a new lease of life would be given to the mine.

Yellow Jacket has been very actively dealt in, and 266 feet were sold, receding from $1,280 to $1,060, rallying to $1,200, dropping to $1,135, again rising to $1,200, and changing hands yesterday at $1,250 @1,232½. We have no direct advices from this mine this week, but learn that recent developments present no marked change.

Alpha declined on Saturday last to $1,130, but rose on Tuesday to $1,500, then receded to $1,425, rallied to $1,500 again, and closed at about $1,500 asked; some 25 feet changing hands. It is said that a formidable body of good ore is now disclosed in the lower level, and that the company's prospects were never more flattering.

Crown Point has been very steadily maintained, and 58 feet were sold, advancing from $730 to $780, receding to $750, rallying to $795, and closing at $825@810. In working up from the 230 feet level and from the west portion of the 160 feet level, good ore is now taken, and some 65 tons are daily sent to the mill, averaging about $38 per ton.

Belcher is in rather better favor, and small sales were made; advancing from $670 to $790, dropping to $750, and selling yesterday at $750@760. In the southern portion of the first level considerable low-grade ore has been found, and from the first and second main stations some 20 tons are daily hoisted to the surface. The shaft is now down 430 feet, and will be sunk to a depth of at least 500 feet, when drifting is to begin and two new levels opened. No dividend will be paid this month.

Hale & Norcross has attracted some attention, and 249 feet were sold, advancing from $525 to $675, dropping to $600, rallying to $660, then selling at $800@690, closing at $665. The company have won their suit against the Bajazet, and are running toward the lead from the bottom of the incline, with some promising indications in the face of the south drift.

Ophir has fluctated but little, and trifling sales were made at $490@ $500, closing at $500 asked. The new engine shaft is now down 500 feet, and drifting at this depth is in progress. The company are daily shipping from the the mine from 35 to 40 tons of ore; a small portion of which is said to yield, at Dall's mill, $200 per ton, and the balance about $50.

Chollar has been very largely dealt in, and 477 feet were sold; advancing from $370 to $400, dropping to $380, suddenly rising to $475, then declining to $400, and closing yesterday at $375. Potosi has also shown great activity, and the large number of 595 feet changed hands; advancing from $350 to $467½, receding to $400, cash, and $375, seller 30, and selling at the close at about $375.

Uncle Sam rose from $125 to $175, fell to $130, rose to $160, and sold yesterday at $150@155. Some rather favorable developments have been made recently.

Imperial receded to $195 on Saturday last; but since then has been in much more favor, steadily advancing to $245, and selling yesterday at $240@230. In all, about 1,125 shares have changed hands. The face of the southwest drift, fifth level, is in good $40 ore, and promises to open into a large body. The southeast drift is also said to look extremely well. Receipts of bullion thus far the current month amount to $30.500.

Bullion rose to $170, fell to $150, rallied to $155, and closed at about $155. Burning Moscow fell from $60, buyer 30, to $51, rallied to $54, receded to $50, and closed at $50.

Spring Valley Water Company fell from $49¾ to $49, and California Steam Navigation rose from 73½ to 74 ₱ cent. Daney has been sold at $10@19; Nevada (J. G.) at $25, and Sierra Nevada at $15.

The recorded sales, at the Board, since Saturday last, amounted to $1,673,696.

How the Late President Looks in His Coffin.

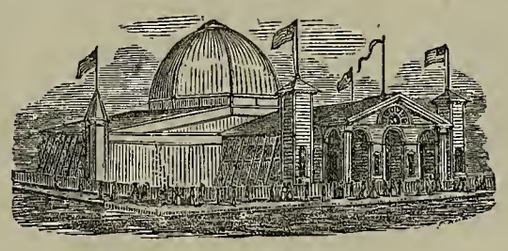
Death has fastened into his frozen face all the character and idiosyncrasy of life. He has not changed one line of his grave, grotesque countenance, nor smoothed out a single feature. The hue is rather bloodless and leaden; but he was always sallow. The dark eyebrows seem abruptly arched; the beard, which will grow no more, is shaved close, save the tuft at the short, small chin. The mouth is shut, like that of one who had put his foot down firm, and so are the eyes, which look as slumber. The collar is short and awkward, turned over the stiff elastic cravat, and whatever energy or humor or tender gravity marked the living face, is hardened into its pulseless outline. No corpse in the world is better prepared, according to appearances. The white satin around it reflects sufficient light upon the face to show us that death is really there; but there are sweet roses and early magnolias, and the balmiest of lilies strew around, as if the flowers had begun to bloom even upon his coffin. Looking on uninterruptedly, for there is no pressure, and henceforward the place will be thronged with gazers who will take from the sight its suggestiveness and respect. Three years ago, when little Willie Lincoln died, Doctors Brown and Alexander, the embalmers or injectors, prepared his body so handsomely that the President had it twice disinterred to look upon it. The same man, in the same way, have made perpetual these beloved lineaments. There is no blood in the body: it was drained by the jugular vein and saeredly preserved, and through a cutting on the inside of the thigh the empty blood-vessels were charged with a chemical preparation which soon hardened to the consistency of stone. The long and bony body is now hard and stiff, so that beyond its present position it can not be moved any more than the arms or legs of a statute. It has undergone many changes. The scalp has been removed, the brain scooped out, the chest opened, and the blood emptied. All we can see of Abraham Lincoln, in this splendid coffin, is a mere shell, an effigy, a sculpture. He lies in sleep, but it is the sleep of marble. All that made this flesh vital, sentient, and affectionate is gone forever.—*N. Y. World.*

THE IMMIGRATION.—The Portland *Oregonian* learns, through a correspondent, that on the 21st of April more than three thousand teams were at St. Joseph ready to start for the Pacific coast, and that is but one of the points on the Eastern border of the Great Plains for the fitting out of such expeditions.

SANTA CLARA COLLEGE.—We acknowledge the reception of an invitation to be present at the annual exhibition of the Santa Clara College, which takes place on the 26th inst.; also at the commencement exercises, which will occur on the succeeding day. We much regret our inability to be present.

IRELAND.—Some leading Manchester men, in view of the end of the American war, propose to start a joint stock company for the erection of calico and linen mills in various parts of the west of Ireland.

NEW WOOL.—The new clip of wool from the sheep ranches along the San Joaquin river brings twenty cents a pound in Stockton.



STRIKES IN EUROPE.—A Berlin letter says: "Almost all the tailors of Breslau have struck work for an advance of wages. The strike of the compositors at Leipsic still continues, and the publishing trade is thrown into great confusion. At Burg, a strike among the factory hands has been going on for some time, and all the efforts of the police and other authorities to induce them to submit to the terms of the masters have hitherto proved futile. In respect to strikes and combinations among workmen, Germany is fast following in the footsteps of England. The interest with which the strikes in Staffordshire and Northumberland have here been followed is a remarkable sign of the times."

CITIES AND TOWNS IN IDAHO.—Boise City has three thousand inhabitants; Ruby and Silver cities, from 600 to 1,000; Idaho City about 4,000. The towns are chiefly of wooden construction, and there is not a fire engine in the Territory.

IT is an old saying that one should get a cage before catching a bird, though we believe birds take their mates before they build their nests, and then, together, they make their home. A hint which perhaps it would be well for young people "of moderate circumstances" to reflect upon.

IT is said that Milton S. Latham is coming to San Francisco with a European capital of five millions to start a bank, of which he is to be the chief manager.

THE FIFTH INDUSTRIAL FAIR

OF THE MECHANICS' INSTITUTE OF SAN FRANCISCO,

To be Held in the Mechanics' Institute Pavilion in August, 1865.

The Mechanics' Institute having determined to hold their Fifth Industrial Fair during the coming season, the Executive Committee would respectfully invite all persons desirous of exhibiting Machines, Manufactures, Agricultural Implements, Horticultural Products, Minerals, Ores, and Works of Art, to make application immediately, in order that the proper space may be allotted them.

The Exhibition will be open to the public on Thursday, the 17th day of August, at 10 o'clock A. M.

The general management of the Fair is entrusted to an Executive Committee, consisting of the officers of the Institute.

No contracts or agreements will be recognized unless made by the authorized agents of this Committee.

A competent person will be in attendance at the Pavilion to receive and register all goods designed for exhibition, and will receipt therefor.

Contributions of Machinery and other articles that require long time to prepare for exhibition, will be received from the 15th of July to the 2d of August.

Articles for exhibition that require large space may be entered on or before the 20th day of July, and space will be allotted to the exhibitor on or before the 2d of August.

The Picture Galleries will be ready for the reception of Pictures, Embroideries, Wax and Fancy Work of all kinds, on the 1st of August, when space will be allotted.

The Committee will be prepared for the reception of Fruits, Flowers, Agricultural and Horticultural Productions, and design to have the tables so arranged that the best display possible can be made in this department, and every effort will be made and care taken to preserve their freshness, so that exhibitors may receive full credit for their productions. Those wishing space on these tables should engage it at an early day. There will be space reserved for additions in this department during the Fair.

The several transportation companies, as on former occasions, have, with commendable liberality, consented to transport articles intended exclusively for exhibition free of charge, and Messrs. Wells, Fargo & Co., in like manner, will take charge of them.

The Committee have the fullest confidence that the coming Fair will not only be the most complete and varied in its character, but will also be more attractive than any previous exhibition of this kind on this coast.

No pains or expense will be spared to give the contributors satisfactory opportunities in the spacious pavilion of the Institute for the display of their contributions, and to furnish whatever may be necessary to make the Fair an institution where those who frequent it may be both pleased and instructed.

All articles forwarded should be labeled "For the Industrial Exhibition," San Francisco.

All communications to be addressed to C. S. HIGGINS, Corresponding Secretary.

NOTICE.

The co-partnership heretofore existing between John Youngberg, Stephen H. Covert and William B. Gleason, is hereby dissolved by reason of the said Gleason and Covert having left for the East. This is to notify all persons that I shall pay no debts contracted by the said parties from and after this date. JOHN YOUNGBERG.

San Francisco, May 15th, 1865. 20v10-1m

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

A CARD.

MR. H. S. JACOBS, formerly of this State and Oregon, adopts this method of calling the attention of his old friends and customers to the fact that he has established himself permanently in the city of New York, having, since his residence in California, perfected and secured by letters patent his celebrated WHEEL-MAKING MACHINERY, which not only materially reduces the cost of manufacture, but makes a much more durable and finished wheel than by the old method. These facts are simply attested by the large and increasing demand for Wheels made by this machinery, as well as by the numerous testimonials furnished by parties who have purchased and tested them. Having made large contracts for timber, selected expressly for this purpose by a gentleman who has had an experience of upwards of thirty-five years, and whose entire attention is devoted to the selection of stock connected with this branch of industry, and having had myself an experience of eleven years in manufacturing in California and Oregon, and being personally acquainted with the sizes, styles, material and wants of these States, I feel the most entire confidence in being able to supply the trade with a better and cheaper article than can be had from any other source, and in whatever quantity may be desired, having on hand at present one of the largest and best assorted stocks of Omnibus, Truck, Cart and Light Wagon Wheels, of all sizes, together with a varied assortment of Hubs, Spokes, Felloes, Bent Rims, Shafts, Poles, etc., to be found in the country—all made under my own supervision and of the very best material and workmanship. All descriptions of well-seasoned Timber kept constantly on hand and supplied in any quantity. Orders for material of all and every kind pertaining to Wagon manufacture will be filled promptly for cash on delivery.

Address, THE JACOBS PATENT WHEEL-DRESSING MACHINE AND WHEEL COMPANY, 99 Wall street and 145 and 147 Bank street, New York.

N. B.—Those desiring peculiarity of style in Hubs, Felloes, Spokes, etc., can be accommodated, and will receive our careful attention by sending samples of the same. [20v10

NOTICE TO MINERS.

THE UNDERSIGNED WILL SELL

MINING STOCK

In Incorporated Companies and Unincorporated Mines, in San Francisco District and in El Dorado District, Arizona Territory. It is confidently asserted and believed by most practical miners that Arizona is the richest mining country in the world. Recent developments of these mines are now attracting the attention of capitalists, who have already erected several mills, and more are going there soon. Now is the time to invest to advantage, and obtain the rise that must soon follow. Those wishing to purchase soon can do so, on most liberal terms, by calling on MR. RODNEY CLARK, 338 Montgomery street (room No. 11), San Francisco, or on H. C. SKINNER, San Jose, California.

N. B.—Freight all the way by water at a cost of 4½ cents per pound.

H. C. SKINNER,
San Jose, California.

San Francisco, April 27, 1865. 17q10

1852. 1865.

Thirteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1852.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

Liberal Terms to Clubs.

THE GOLDEN ERA is furnished to CLUBS at the following rates: Three Copies, one year, Ten Dollars; Five Copies, one year, Fifteen Dollars; Ten Copies, one year, Twenty five Dollars. An extra copy will be forwarded, free, for one year, to the person sending a club of five or ten subscribers.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

IN THE GOLDEN ERA,

"THE FAIR LILIAS;"

Or, "LIFE IN DEATH,"

A New Story, by PIERCE EGAN, Author of "The Poor Girl," "The Flower of the Flock," "Lady Maud," "The Snake in the Grass," "Such is Life," Etc.

PIERCE EGAN is undoubtedly the most fascinating and attractive Novelist of the age. His stories are eagerly sought for, read and admired by hundreds of thousands in England and America. "THE FAIR LILIAS; or, Life in Death," surpasses, in exciting interest and thrilling situations, all of the productions of the celebrated author, and is Pierce Egan's masterpiece.

THE GREAT SERIAL,

"OUR MUTUAL FRIEND,".....By Charles Dickens.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indisputably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

BROOKS & LAWRENCE,

GOLDEN ERA BUILDING,
No. 543 Clay street, near Montgomery, San Francisco.

Mechanical.

RECENT CALIFORNIA INVENTIONS.

Mr. Wm. Edwards, of Antioch, in this State, has invented a new and important improvement in the mode of placing grates in furnaces, which he claims is much superior to any other arrangement hitherto devised. The invention may be described as follows: He places the grate or bars, on which the fuel rests, in an inclined position, in which they form an angle of from fifty to sixty degrees with a vertical line, thereby relieving the draft and giving a higher degree of heat with the same amount of fuel than is done by furnaces with a horizontal or flat grate. The feeding of the fuel into this grate is accomplished by means of a hopper or chute placed above the furnace, which admits of the coal being fed in by degrees. Mr. Edwards has filed a caveat for his invention through the Mining and Scientific Press Patent Agency.

A New Life-preserving Raft and Pontoon.—Mr. Edward Hawthorne, of this city, has invented a new and useful life-preserving raft, which may be described as follows: Any desirable number of galvanized iron tubes, closed at both ends, made of one-sixtecnth iron and about twelve inches in diameter, are placed parallel to each other. At right angles on each end of these tubes is placed a spar about six inches square; around the tubes are placed iron bands, completely encircling each and having an arm extending upwards through the spars, a thread being cut on these arms for a nut, but leaving sufficient length to the arm to extend upwards through a layer of plank, across which, at right angles at each end of the raft, is placed a cross-piece, through which the arm of the encircling band extends, having a key-hole, in which the key is placed. By means of the nuts and keys described, the whole structure is firmly bound together, rendering it almost impossible for the waves to dash it to pieces. Mr. Hawthorne has filed a caveat for his invention through the Mining and Scientific Press Patent Agency.

Mr. Francis Kesseler, of this city, has invented a new mode for attaching wash-basins to tablets, which consists in the employment of clamps or flanches, of iron or other material, having bolts and nuts, the ends of the bolts being leaded into the tablet. For the purpose of rendering the basin water-tight where it is joined to the tablet, he employs an India rubber band, which is placed between the tablet and flange or edge of the basin, the whole being kept in place by means of the bolts and nut. Mr. Kesseler has made application for letters patent for the invention through the patent agency connected with this office.

Thin Sheet Iron.—Assuming that the 2,000th of an inch is about as thin as iron can be rolled in sheets of more than a few square inches surface, the Hope Company has tried the experiment of producing a large plate of that substance, and have succeeded in turning out a very beautiful specimen two feet two inches in length and eight and one-half inches wide, the surface contents being, consequently, no less than 221 square inches; and it is stated that the managers are sanguine that they will succeed in rolling similar sheets sixty inches long. The iron appears to be of excellent quality, and with the exception of one or two extremely fine holes, which are observable by placing a strong light behind it, the sheet is perfect. The weight is somewhat under 178 grains, which is at the rate of 1.25 square inches to the grain. Compared with the thinnest tissue paper that can be purchased, the iron is so thin that it would require five sheets of the metal to amount to the same thickness as three sheets of the tissue paper. Whether further efforts will be made in the same direction, of course we do not know; but we think it must be admitted that whether in the production of thin iron or of thick—for it must be remembered that it was the 13½-inch armor plates of John Brown, of Sheffield, that led the Sligo Works to roll their thin sheet—the English manufacturers are thoroughly able to produce any quality that may be demanded of them.—*London Artizan.*

Since the above publication from the *Artizan* we have seen it stated, but without any definite authority, that small samples of iron have been rolled in England so thin as to require 4,800 leaves or sheets to the inch. Tin foil is usually about 1,000 thicknesses to the inch, while gold leaf is beaten to the 280,000ths of an inch.

VALUABLE AND IMPORTANT INVENTIONS.

Two inventions, which bid fair to work a most important revolution in the present system of levying freights, have recently been patented in England. These inventions are the cumulative power cotton press and the arrow tie, for securing pressed packages. The one is capable of pressing cotton, wool, hay, etc., to almost any required density, while the latter affords a cheap, convenient and almost instant binding, from which expansion is impossible.

The press consists of a simple and ingenious combination of the lever and pulley, by which an ordinary bale of cotton may be pressed so firmly that fifty pounds will occupy but a cubic foot of space. This result can be obtained by steam power in one minute and a half, with horse power in three minutes and a half, and by man power in from five to ten minutes. This is a reduction of nearly *three times* the ordinary density or space occupied by the methods of pressing heretofore employed. By this system of pressing a ship loading with cotton, wool or hay may be made to carry nearly three times as much as one loaded with the same articles pressed after the ordinary manner. The saving of freight upon compressible merchandise must be apparent to all, and hence the claim which is set up for its probable effect upon the present system of levying freights. It may be stated that the fibre of neither cotton or wool, nor the quality of hay, is injured by the compression to which it may be subjected in this press. The inventor and patentee of this press and tie is Mr. J. J. McComb, of Liverpool, and we understand that Mr. E. C. McComb, of this city, has ordered one of the presses and a supply of the ties, both of which are now on their way to San Francisco. It is designed to employ the press in baling wool in this city for shipment. We presume it might also be used to great advantage in the interior for baling hay. These presses are constructed of three sizes—No. 1 presses cotton to a density of fifty pounds to the cubic foot; No. 2, forty pounds, and No. 3, thirty pounds. The presses are spoken of in the highest terms by the Liverpool papers, in which city they have been put to a practical test.

More of the Gun Cotton.—Mr. Clary, the gentleman to whom we have already alluded as having imported a small invoice of gun cotton, with the view of subjecting it to a practical test in California mines, has just returned from Calaveras county, where he has been experimenting with this new explosive compound. We have before us a certificate from the superintendent of the Napoleon Copper Mine, Mr. J. A. Steinberger, who states that he has made a trial of it in that mine, and that "the result has been very flattering. Of its power, execution, economy and safety there can be no doubt. It makes, in blasting, very little smoke, being a great advantage in a mine." Probably nearly, if not quite all, the smoke which Mr. Steinberger noticed was produced from the fuse used to fire it. Another certificate from Mr. Miller, Captain of the mine of the Philadelphia and Pacific Copper Mining Company, at Live Oak Hill, certifies that he has made a trial of the cotton, and that "the result has been a thorough proof of its value. It makes no smoke, is of full power, and possesses every quality required for blasting purposes." We have little doubt but that this new explosive material will soon come into quite general use in the mines, much to the advantage and safety of the miners.

A plan for preventing the annual and troublesome Spring floods at Albany and Troy is to sink a number of torpedoes in the river the day after navigation is closed in the Fall. Those in each thousand yards could be connected and fired by one fuse or electric current, all ready to be exploded when there are indications of the breaking up of the ice. That would send the ice down the river and leave free course of the water to follow.

THE FOUNDRIES.

The business of the principal foundries, this week, shows a marked improvement over that of a month since. But few very large orders are recorded for the past month in the establishments noticed this week; but the amount of general work has largely increased, the number of men employed is greater, and an air of increased activity and cheerfulness seems to prevail.

At the Vulcan, the principal feature of the week is a large engine, building for the Yellow Jacket mine, believed by the proprietors to be the largest horizontal engine for mining purposes ever built in the State. It is twenty-two inches in diameter of cylinder, and six feet stroke, and capable of driving an eighty-stamp mill. The patterns were designed at this establishment, and judging from them, this engine will be one of the most beautiful, as well as one of the most powerful machines in the country. The fly-wheel, eighteen feet in diameter, cast in sections, with arms in the shape of pillars, and a rim formed like a succession of arches, is a real triumph of the designer's art, while every other portion is to be finished in a style equally beautiful and unique. With this engine will be also shipped several of Hepburn & Peterson's amalgamators for the same mill.

In addition to this, we noticed a fourteen-inch cylinder engine, three feet stroke, which is building for Fauchery & Genard, of this city, the destination of which is unknown. An engine of sixteen-inch diameter of cylinder and four feet stroke, with a twenty-stamp mill, and one of Hepburn & Peterson's pans, was last week shipped to the Seaton mine, at Grass Valley. One of Baux & Guiod's amalgamators has also been built for the Mina Rica mill, near West Point, Calaveras county. The same company have ordered a fresh supply of shoes and dies for their mill, so we expect that our friend Morris will soon have the pleasure of setting his fine mill and mine in active and profitable operation.

The Miners' Foundry shows the same enterprise and energy as ever. Among the novelties at this establishment is a large hydrostatic engine, of Hansbrow & Redding's pattern, the destination of which was believed to be Volcano, Amador county. A 120-horse power engine, with a twenty-stamp mill, was also building for Montgomery District, Esmeralda; while three sixty-horse engines, for Reese River, were nearly finished, each with a twenty-stamp mill. A ten-stamp water mill, to be driven by means of a cast-iron turbine wheel, was also building for the Truckee, Mono county.

Goddard & Co., of the Pacific Works, are doing a large amount of marine work, including the machinery of a powerful propeller, intended as a tow-boat on the Bay. The cylinder of this engine is three feet in diameter and thirty inches stroke, and will be supplied with steam by two horizontal tubular boilers, each sixty-two inches diameter and seventeen feet long, also building at this establishment. We also noticed a twenty-stamp mill, with engine sixteen inches diameter and three feet stroke intended for Idaho, and a large steam flouring mill, for Portland, Oregon. We were particularly struck with the neatness and order displayed in every department of this immense establishment, in which particulars its example might well be followed by some of the most prominent Eastern works of the kind.

Testimonial to Commissioner of Patents.—The clerks and employees in the Bureau of the Commissioner of Patents (Hon. D. Holloway) recently presented that gentleman with a handsome album containing their photographs, about one hundred in number. The occasion was the fourth anniversary of the day on which Mr. Holloway commenced the supervision of the Patent Department; and his associates took that method of expressing their appreciation of the uniform kindness they had received at his hands, and their respect for him as an officer and a gentleman.

A good short-hand writer is able to report from one hundred and fifty to one hundred and seventy-five words a minute.

It is stated as a remarkable fact that the late President had not a blood relation, save his two boys.

Another California Invention.—The Grass Valley *National* says a gentleman named Dodge of that place, has invented a self-loading and unloading dirt-wagon, which is destined to work a revolution in excavating and removing dirt. It is made with four wheels, drawn by horses, and takes up the dirt under the forward axle. The scoop, made of heavy boiler iron, well riveted, is about four feet long, thirty-two inches wide and one foot in hight. Attached to the scoop are two handles about three feet long. The scoop swings from an iron rod extended across, and can be swung from the ground or remain on it at the will of the person who has the machine in charge. The inventor has been at work on the plan for several years, and feels confident he has now achieved success. Wagons of almost any capacity desired can be made. The inventor claims that it can be made to work in any place where the ordinary scooper can be used. It appears to be well calculated for employment in building the immense reservoirs in the mines, in cutting large ditches and canals for irrigating the extended parched-up plains, thus making beautiful homes of places which would otherwise remain forever dried and parched up by drouth and heat. It is in fact a shovel upon wheels, easily manageable and eminently effective.

An Improved Hay Fork.—The Stockton *Independent* has the following account of a new pattern of hay fork, worked by horse power, and capable of lifting half a ton of hay at a time. It was invented by Matteson & Bro., Stockton:

The fork itself will weigh probably about one hundred and fifty pounds—the prongs, twelve in number and made of cast steel, weigh sixty pounds—and is constructed so as to be used with facility in lifting hay from the ground, a loaded wagon or removing it from a stack, as necessity may require. In working it a crane is used, and the fork is hoisted with blocks and tackle by a single horse. By the crane the load can be easily carried to the place where it is wanted, in the barn, on the wagon or the stack, as the case may be, and is thrown from the prongs by pulling a small cord attached to a lever, by which the fastenings that hold the fork level while being hoisted are displaced and the hay thrown out. The mechanical construction is not complicated, and the invention is one that will undoubtedly prove useful as a cheap means of moving hay.

Lucifers without Phosphorus.—Dr. Herpe, a German chemist, employs for the production of the heads of lucifers a mixture of four to six parts of chlorate of potash, and two parts each of bichromate of potash and of oxyd of iron or of lead, with three parts strong glue. For an igniting surface he uses a mixture of twenty parts strong glue or gum. These matches will ignite only on the surface thus prepared. Dr. H. Polter, another German chemist, uses for the match heads a mixture of chlorate of potash and a salt, which he describes as a compound of hypo-sulphurous acid with soda, ammonia, and oxyd and sub-oxyd of copper. Lucifers made in this way are, however, objectionable, from the fact that they will ignite on any rough surface, even more easily than the common kind. Any good mode of rendering the use of phosphorus unnecessary would be a great advantage; as not only does it cause in those obliged to manipulate it a very terrible disease of the jaws, and give rise, very frequently, to destructive fires, but the supply of it is far from abundant, and is withdrawn permanently from the soil, to the great injury thereof.

A useful invention has been introduced in the omnibuses of Paris. When the "bus" is full, the conductor uncovers the word "*Complete*," and, at the same time a similar sign suddenly appears in front of the driver's box, so that pedestrians wishing to ride are informed that they must wait for the next conveyance.

A similar device ought to be employed on the cars in this city.

Destructive Fire.—San Francisco was visited with a very destructive fire on Sunday evening last, which destroyed property to the amount of about $100,000. The scene of the conflagration was at the foot of Market street at its junction with Sacramento street. The firemen worked like heroes, and it was only by their almost superhuman efforts that they were able to stop the fire where they did. Quite a number of them were burned by too severe and prolonged exposure to the flames. The fire was undoubtedly the work of an incendiary. The place where it broke out—a store-house for hay—was also set on fire in February last.

A rich Englishman has entered into negotiations for the purchase of three-fourths of the island of Caprera, in order to present it to Garibaldi, who already owns the remaining fourth. The entire land is valued at $16,000.

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:

Saturday Morning, June 24, 1865.

Removal.

The Office of the MINING AND SCIENTIFIC PRESS has been removed to the old printing stand known as Waters Bros. & Co., southwest corner of Clay and Sansome streets, opposite the Niantic Hotel (being one block south of our former location), where we may now be found, with more commodious apartments and an extensive JOB PRINTING OFFICE.

San Francisco, April 10th, 1865.

Canvassing Agents.

We would call attention to the following named agents of the MINING AND SCIENTIFIC PRESS as gentleman worthy of the countenance of any community which they may visit, and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the PRESS, will be acknowledged as a personal favor to us:—

Mr. Robert Lattimore—Amador and Alpine counties and the State of Nevada.

Thos. Poyzer, of Grass Valley, for Nevada, Yuba and Sierra counties.

RICH SPECIMENS.—At the store of Messrs. J. M. Hurlbutt & Co., No. 407 Battery street, may be seen some extraordinary specimens of cemented gravel rich in gold. There are lumps of cement ("blue gravel") literally filled with specimens of coarse gold, varying in size from the finest scale gold to lumps as large as a pigeon's egg. These specimens surpass in richness anything we have ever seen from gravel diggings. The claims from which the specimens were taken could have been bought a few months since for a comparatively small sum, but are now worth many thousands of dollars. They are located on the high banks of the Yuba river, at a point near Washington, where the blue gravel range crosses that river. The claim is now known as the Milton Willis, formerly the Golden Heifer. The fortunate owners are Major A. Moon, H. G. Phillips and Jacob Snyder, of this city, and T. D. Woolsey, who resides at and has charge of the claim. The cement is of so firm a nature that it has to be crushed in a mill to release the gold. A recent run of three nights, with five stamps, gave $650. The mine is not yet fairly opened. Major Knowlton and Oscar Maltman, of Nevada City, the principal owners of the adjoining claim, propose to erect a mill upon their ground at an early day. There are some twelve companies operating in this vicinity.

ANOTHER LARGE MINING SUIT.—The Bullion Company, having got through with the Minerva, is now preparing for a long tussel with the Alpha, having commenced a suit for about one hundred and fifty feet of ground held by the latter. The lawyers are bound to eat up the profits of a large portion of our Washoe mines.

A PORTABLE ENGINE has just been turned out at the Golden State Foundry for the California Steam Navigation Co., to be used upon the levee at Sacramento. It is a thoroughly built piece of machinery, and will prove far preferable and more durable than the imported engines.

SHEBA, STAR CANON, HUMBOLDT COUNTY, NEVADA.

BY DON AUGUSTIN.

The present condition of the affairs of the once famous Sheba is such that to mention Sheba stock among brokers causes a smile at what many call "the biggest bilk in the market." Many are in the habit of speaking in a trifling manner concerning any and all mining incorporations. Such parties never hesitate in accusing mining trustees of concocting and executing the meanest of swindling schemes; but they do it in such an indefinite manner that no definite crime can be publicly charged against any one. Sheba, for a long time past, has been the subject of complaint of this class of habitual croakers. During the last few months, however, a class of stockholders not given to narrow-minded suspicions, have become dissatisfied with the manner in which they have been assessed, the great expenditure of money, and the lack of returns warranting such an expenditure. Shareholders were led to believe at one time that there were over 1,000 tons of ore out and ready for shipment and reduction. Firm in this belief, they willingly went to the expense of a mill and roasting furnaces. The President of the company now declares that when he visited the mine there were but about 200 tons of ore to be seen, and he does not hesitate of accusing the then Superintendent of dishonesty, in promulgating this story for stock speculative purposes. He says there was no necessity for the mill, and that the erection thereof is one of the causes of the Sheba's present embarrassment. Be that as it may; it is not intended to discuss the honesty or dishonesty of any one or more individuals in this article. Several of the trustees, who have lost fortunes on Sheba stock, must, rather than accuse any one, take all the blame upon themselves, for allowing any employee to deceive them in such a manner. When the necessity of reduction works was mentioned, it was the duty of the officers to see that such a necessity actually existed. It is their duty to be thoroughly informed regarding affairs at the mine, and not to work on a mere supposition. This argues badly for the business capacity of the Sheba's Trustees. Managers, by a judicious course, can always regulate the market value of their stock. They should as much avoid an undue inflation as a ridiculous depression of its value in the market.

At an adjourned meeting of the stockholders, held a few days since, many members wishing to be more fully informed regarding the value of their property, so as to form their own opinions of the judiciousness of investing any more money in working the mine, proposed sending a committee of two of their number to examine and report on the same. The President of the company opposed this, on behalf of the Trustees, on the ground that the financial condition of the company warranted no such outlay. We would remind the President, that had the full knowledge of the prospects of the mine been known, as it should have been, no one would have been deceived with such clap-trap as "1,000 tons of ore out, and any amount more in sight." The inflation of Sheba was one of the causes, and truly a just cause of the present insolvency of the company. We will now look at this financial condition, that warrants so little at present, and scarcely promises more for the future.

The Sheba was incorporated, for mining purposes, March 5, 1863. It has collected assessments and expended money, according to its books, in the following manner:

Cash collected on assessments (the total amount of which is $202,230)		$162,605 00
Product of the mine		59,486 59
Custom work of mill		3,360 03
Profits on boarding house at mine		803 39
Making a total of		$226,255 02

The expenses were as follows:

MINING.

Mine account	$76,660 70	
Buildings at mine	3,019 37	
Superintendent's expenses at mine	3,232 55	
Assorting ores	5,631 04	
Office fixtures of Superintendent	514 37	$89,058 03

REDUCTION WORKS.

Transportation of mill	$12,933 31	
Buildings and furnaces	18,132 21	
Construction of mill	16,924 73	
Purchase of mill site	367 50	
Expenses running mill	28,069 70	
Operating on ores	2,784 00	
Building house at mill	2,649 90	
Superintendent's expenses at mill	722 18	$82,583 53

OTHER EXPENSES, ASIDE FROM MINING OR MILLING.

Purchase of contract	$25,000 00	
General expense account	7,854 21	
Road building account	4,405 05	
Freight on ore	6,776 47	
Freight on bullion	2,061 85	
Salaries of officers	16,354 47	
Legal expenses	3,152 00	
Interest and exchange	8,946 53	$74,550 58
Showing a total expenditure of		$216,192 14

There were some minor items of debit and credit, amounting in all, say $200 or $300. These being of no importance, and our time but limited, they were omitted.

This showing, from the Secretary's books, leaves the company about $20,000 in debt on the first of May, 1865. To meet which, there are uncollected assessments amounting to $39,615. Some of this stock being delinquent, it was put up at sale, but not enough was bid to pay assessments. More of it was restrained from sale by legal injunctions. Despite these injunctions and the impossibility of selling delinquent shares for assessments, the Trustees have levied assessments, one after another, until the amount before mentioned has become delinquent. Some of the stock on which there are delinquencies, stands in the name of and is owned by several of the present Trustees. Truly, a queer way of managing a trust. Why consent to levy an assessment if there is no intention of paying it?

To an unprejudiced mind, it would seem that the present Trustees of Sheba, with probably one or two exceptions, are very well content to manage Sheba affairs and spend its money; but so little confidence have they in their own management that some entirely neglect to pay their proportion of these expenses, while others hold barely enough stock to enable them to remain officers. On these latter their infinitesimal pro-rata of the expenses must have been a burthen. When the managers exhibit so little confidence in their own ability, is there any wonder that shareholders refuse to pay good coin for such a set of Trustees to throw away, after the quarter of a million already expended? Sheba stockholders should retain these same Trustees in office; their superior business capacity, as evinced, justifies it, most certainly.

Now, let us examine and see what practical benefit has been derived from this expenditure of $246,192 14. According to the figures given by the President himself, and from drawings of the works, there have been about 2,000 feet of tunnel run and 400 feet of shafts sunk, and there are now out about 100 tons of ore. All can be summed up thus:

One mill and furnaces, worth	$40,000
2,000 feet tunnels, 400 feet shafts, worth	50,000
100 tons ore, worth	10,000
	$100 000

There is one item in "Other Expense" column that I must explain. It is $25,000 purchase of contract. It seems that the Board contracted with one Templeton for certain work to be done on the mine. At a later day this wise Board deemed it best that the company should purchase the contract from Templeton. So, after mature deliberation and legal consultation, it was bought for $25,000, and expenses incurred for legal advice and interest amounting to $8,000 additional. It now seems that one Davis, and may be others of the Board, were interested in this contract on the Templeton side; whether before or after the purchase, deponent knoweth not, nor careth. Was this one cause for Sheba's embarrassment? Comment on the various other expenses is entirely unnecessary. Let the reader make them himself and form his own opinions.

There is another point worth mentioning. Many advertisements of Sheba delinquent lists have appeared in supplementary editions to a daily paper. The MINING AND SCIENTIFIC PRESS has over and over again cautioned mining companies of the illegality of this mode of advertising. Why does Sheba not advertise in the PRESS, instead of paying four-fold to obtain the same object, in dailies. Is this one of the boasted freaks of economy that will not admit of a committee visiting the mine?

And this is the mine of which Professor B. Silliman, Jr., wrote, under date of October 25, 1864:

"*First.*—The Sheba mine is explored on a true mineral vein of peculiar character, but well charged with silver ores of the richest character."

"*Second.*—The mine as now explored is capable of supplying the present mill with all the ores it may require, of an average value of not less than $150 to $175 per ton."

"*Fifth.*—The existing mill and mine, as at present developed (granting the present average of ores to continue), will discharge the existing obligations of the company, fund a sufficient sum to pay for the enlargement of the mill, and justify the expectation of a moderate dividend at an early day."

From this it is very evident that Professor Silliman was no Trustee of the Sheba Company.

In conclusion, I am willing to admit that Silliman, Jr. is eminently qualified to decide upon the character of mineral veins. He is well versed in geology, mineralogy, and all pertaining thereto. His reputation as a man of honor and veracity has never been impeached, and therefore, whenever a gentleman of his character and ability gives an opinion regarding a mine, it should and will have due influence. One thing, however, Mr. Silliman will please note, *i. e.*, when he writes of the "funding of sufficient sums" and the "expectation of moderate dividends," it becomes evident that his scientific attainments are insufficient to enable him to fully comprehend the great financial abilities displayed in managing the affairs of the Sheba Company, whose "mine is explored on a true mineral vein of peculiar character."

COMPLIMENTARY.—Dan de Quille, of the *Territorial Enterprise*, appears to have been very much interested in a series of articles which so recently appeared in the columns of this paper. We give his opinion, by way of a relish, to spice our usually dry and matter-of-fact reading. Here is what he says of it:—

Here in the MINING AND SCIENTIFIC PRESS we find a splendid article for Sunday reading. It is entitled "A Discussion of the Tractory and Differentially Formed Grinding Plates" I know of a great number of romantic persons who have lost much sleep on account of this enchanting bit of word painting. At first I supposed the grinding plates mentioned were some sort of grinding plates used as a substitute for false teeth; now, however, I find that the plates spoken of are used in amalgamating pans. I cannot for the life of me agree with all the propositions of the author. For instance, when he says: "The involute of the common cycloid is similar and equal to the evolute, that is, the cycloid itself. But the cycloid is essentially dissimilar and unequal to the catenary. Therefore, the cycloid and the involute of the catenary cannot both coincide with, or be the *Tractory*." What an absurd idea! Now I am certain that the cycloid and the involute of the catenary cannot but coincide with the Tractory. They have been doing so in this country in the most peaceful and lamb-like manner ever since the spring of '59. If the cycloid and involute cannot agree with the tractory in California it must be on account of the climate. To show how foolishly the writer of the above is talking, let us suppose for a single moment that there should be a falling out between the cycloid, the involute of the catenary and the tractory. What would be the consequence to this country—this hemisphere?—Why even a child can tell. The directrix of the tractory would at once begin decomposing the differential equation and the co-ordinates of the curve differentiating with the constant tangent would turn parallel with one of the axes, transposing the integrating power and reducing everything to a common denominator. This everyone knows would be the greatest calamity which could possibly befall a nation, and would be more particularly disastrous in this State just now when stocks of all kinds are down to such a low figure and the Fire Department of this city in an unsettled condition. I am sick of such twaddle as that the cycloid and the involute of the catenary cannot coincide with the tractory. Does the writer wish to see stocks go down to a still lower figure? Is he a base hireling employed by the bears? or does he wish to see all our fire engines again turned "tongue in," and the hats of all the firemen hind part before? I hope to hear no more of the fellow's nonsense.

A SINGULAR PHENOMENON.—A most singular phenomenon in the shape of a lake of water has made its appearance in Nitany Valley, Center county, Pennsylvania, about three miles from a place called Horntown, on the Hublesburg road, covering about one hundred acres of land, and varying in depth, according to the irregularities of the ground, from ten to thirty feet—some say fifty feet. The water is said to come up with force. A subterranean stream has probably bursted upward. The water is said to fall a little during the day and rise again during the night. It is certainly a great curiosity, and has been visited by a great many people.

Mr. Sherman was a Representative in Congress from Connecticut; his business had been that of making shoes. John Randolph, who had Indian blood in him, rose, and, with his usual squeaking sounds, said: "I should like to know what the gentleman did with his leather apron before he set out for Washington?" Mr. Sherman replied, imitating the same squeak; "I cut it up, sir, to make moccasins for the decendants of Pocahontas."

IT is said that a Philadelphian has invented a contrivance to prevent cars from running over any individual who chances to fall in advance of or from the front platform of an approaching car. It is further stated that the inventor has tested the invention several times by throwing himself before a car and found it to work admirably.

ORES FROM EGAN CANON.—While at the metallurgical works of Kimball & Murphy, on Bryant street, a short time since, our attention was arrested by several sacks of very fine looking ore, which we were told was from Egan Cañon, to the eastward of Austin, Reese River, and which they were then putting through a practical working test. The result of those tests has since been placed in our hands, as follows :

	Gold.	Silver.
Lot No. 1, by amalgamation	$25 08	$213 22
Lot No. 2, smelted		680 00
Lot No. 3, amalgamated	62 89	232 17
Lot No. 4, smelted		545 45
Lot No. 5, amalgamated	108 24	336 08
Lot No. 6, amalgamated	7 47	78 03
Lot No. 7, amalgamated	5 91	166 28

ANOTHER WOOLEN MILL.—The Sacramento *Bee* is informed that an incorporation for the construction of a woolen mill in that city is in process of formation among the business men of Sacramento.

PETROLEUM MATTERS.

The steamer Del Norte, which left this city on Tuesday, for Humboldt Bay and Crescent City, took to the former place twenty-one sets of boring tools, and fifty cabin and one hundred and seventy-five steerage passeogers—the most of the latter Chinamen, bound to Creseent City. The Jeffrey Company, on Mattole river, sent up two sets of tools, with the President and H. Wentworth, a practical oil borer. Mr. Robert Kirk, of the Paragon, also took up two sets of tools with an experieneed borer. Mr. Kirk took with him tubing materials, provisions, carpenters' tools, etc., and will eommenec active operations on the mine at once.

Mr. Henry Palmer, a well borer, went up with six sets of tools and assistants prepared to take contracts for boring wells. Mr. Joel Halstead also took up two sets with the same object in view. We noticed a portable steam engine on board, probably destined to do serviee at some of the wells.

Devoe, Dinsmore & Co. are making a set of tools for tbe Humboldt Oil Company, whicb go up on the next steamer.

The erude oil brought down a few days sinee from the Union Mattole Coopany is now io process of being refined by Mr. Benoist, on Third street. Sixty gallons of refioed burning oil from the erude material have already beeu delivered at the Company's offiee on Merehant street. The quantity of luhrieating oil contained has oot yet been ascertained.

We understand that the Santa Clara Petroleum Company, near Lexington, aod ahout twelve miles from San Jose, are now down upwards of 150 feet, and that the oil now fills the well to within ten feet of the top. There is very little water with it. The oil rises higher and higher as successive seams in the roek are passed through. It is eonfidently expected that when the next seam is struek the oil will flow over the top of the well. It is thought at least five or six barrels per day can even now be taken from the well. We have a sample of this oil now upon our table. It appenrs to be of a very excellent quality fully eqnal to that from Mattole river.

The Humboldt *Times* says that a company is in proeess of formation with the view of sinking a well at some eligible point in the vicinity of Eureka, in scareh of oil.

Oil has been discovered in the southwestern portion of Shasta county, where it is thougbt it will yet he found in considerahle quantities.

Several new oil companies have been formed the past week. The Empire Company has been organized for working in Colusa county; the Liverpool Company, with a capital of $6,000,000 for working oil lands at various localities and for mechanical purposes; the St. Petersburg Compauy has heen organized for similiar purposes, also with a capital of $6,000,000.

THE "Miner's and Traveler's Guide" to Oregou, Washington, Idaho, Montana, Wyoming and Colorado, is a valuable little work for persons traveling who intend visiting Oregon or any of the northwestern territories or mines. The work appears to have been prepared with much care by Capt. John Mullan, a gentleman eminently qualified for such an undertaking, having been for some time superintendent of the Northern Overland Wagon Road, and one of the Commissioners of the Northern Pacific Railroad. The work has been prepared with the view of being placed in the hands of trnvelers in that direction and is well filled with valuable advice and important information. It will also be found as useful to the general reader as a book of reference. For sale by H. H. Bancroft & Co.

THE SHEBA MINE.—Wc would call the attention of our readers to the communication in another column with regard to tbe affairs of the Sheba Mining Company. Our correspondent treats of facts only, leaviug the reader to form his own conclusions.

A HEAVY BLAST.—Two hundred and fifty kegs of powder were to have been fired, at a single blast, in the Eureka elaim, North San Juan, some time during the past week.

Use of the Arms in Walking.

Dr. Dio Lewis does not believe io muffs. In a reeent publication he says :—

The first time you are wnlking with your arms at liberty, stop moving them, and hold them by your sides. You will be surprised to fiod how soon your companions will leave you behind, although you may hurry, twist, wriggle, and try very hard to keep up. One reason of a slow walk among girls is to be found in this practice of carrying the arms motionless. Three miles an hour, with the nrms still, is as hard work as four miles with the nrms free.

I have seen the queens of the stage walk. I have seen a few girls and women of queenly bearing, walk in the street and drawing-room. They moved their nrms in a free and graeeful manner. Could this habit beeome universal among girls, the ehests would enlarge, and their bearing be greatly improved. See that girl walking with both hands in her muff. How she wriggles and twists her shoulders and hips! This is beeause her nrms are pinioned. Give them free swing, and her gait would soon become more graeeful.

You have seen pictures of our muscles. Those of tbe upper part of the body, you remember, spread out from the shoulder in all directions like a fan. Now, if you hold the shoulder still, the musele of the ehest will shrink, the shoulders stoop, and the whole chest become thin and ugly.

But some girls will say, "swinging the arms must be very slight exereise." Trne it is very slight if you swing the arms hut once or ten times, but if you swing them ten thousand times in a day, you will obtain more exereise of the musele of the ehest than by all other ordinary movements combined. Indeed, if I were asked what exereise I thought most effective for developing the chests of American girls, I should reply at onee, swinging the arms while walking.

About Sleep.

There nre two kinds of sleep—the complete and the ineomplete. Complete sleep is a temporary metaphysical death, though not an organie ooe. The heart and lungs perform their offices with their accustomed regularity. It is characterized by a torper of the brain, of the external senses, and of voluntary motions. Incomplete sleep is the activity of one or more of tbe cerebrian organs, while the others are in repose; this oceasions dreaming.

Sleep is variously affeeted by health and discase. Man in time of bealth sleeps tranquilly. He arises in the morning, refreshed and prepared to go forth to his daily labor, New strength is given him; langnor is gone; and all the faculties, both mental and corporeal, are recruited. But the sleep of disease is far different. It is short and unrefreshing; disturbed by fearful dreams. Stupor and sleep are different, though supposed by some to be synonymous. In both there is iusensibility; but it is easy to wake a person from sleep, while it is sometimes almost impossible to arouse one from stupor. It is frequently the case in sickness that the person lies for several days in stupor, totally insensible.

Though sleep be nutural, and neeessary to the languid, mental and corporeal faculties, yet it is frequently brought on by some external cause. Heat produces sleep. We witness it in the summer season; it is common to see the laborer devoting an hour in the heat of the day to sleep. A heated church and dull sermon are almost sure to bring sleep. The heat of the church might be resisted, but the sermon is irresistible. Its monotony falls in leaden accents on the ear, and subdues the most powerful attention. Variety, whether in sight or sound, prevents sleep; while excessive monotony of all kinds is apt to induee it. Excessive cold, as well as heat, produces sleep. A person without sufficient clothing on his bed will find it difficult to sleep at night; but it is a fact that sleep is produced before death, when freezing takes place.

NEW FUEL.—A new form of fuel, composed of peat and coke, has beeu patented hy Mr. William Smith, of Dublin. The compound is inteuded to be used in the smelting of iron, and it is thought that its employment will result in the production of iron equal in value to that now manufactured in Sweden. The preparation is as follows: The coke (or charcoal) is reduced to powder and mixed with wet peat. The mixture is tben passed through moulds, and the blocks thus formed are submitted to pressure and dried. The inventor states that peat charcoal thus prepared will stand the blast and burden of a blast-furnace, and may be used with as much advantage as perfectly pure charcoal.

VALUABLE CURIOSITY.—Barnum has offered $1000 for tbe pillow of the bed on which the President died, the same to be placed in his museum. It is not likely that his offer will be accepted, as it is proposed to give the bedstend and clothing to the Government to be put in tbe Patent Office.

A GREAT NATURAL CURIOSITY.—A gentleman who has just arrived from the New Truckee District tells of a very singular mountain situated about ten miles south of Pyramid Lake, on the east side of the Truckee. The whole mountain is made up of stones scooped out in the form of cauldrons, all filled with fine sand. Some of these are nearly fifty feet in circumference, the shell being about six inches in thickness. These shells, which are shaped like the half of an orange, are of all sizes, being from three inches in diameter to near twenty feet. The shells are all formed of the material, a sort of porous limestone, and all are filled with sand. The whole mountain seems to be made up of these singular stones. Surrounding the mountain are hills of fine sand. Owing to the drifting of the fine sand of which these hills are composed, they are constantly changing their shape. Altogether this Truckee region is one well worthy of the attention of curiosity hunters. Besides the famous hot springs and the natural punch bowls we have mentioned, there is a mountain abounding in petrified eggs of all sorts and sizes. It was here too that the remains of the celebrated fossil elephant were found.—*Enterprise.*

IS IT A "FREEZE OUT" GAME.—The Alpine *Chronicle* asks this question, and says: The I X L Company have lately had several tons of ore worked at the Pioneer Mill, by the Rivot process, and at Whiteside,s Mill, with a result highly gratifying to all interested in our county, and stamping it as one of the richest silver mines on this coast. It has been supposed by the stockholders here that our mills would be kept constantly employed on ore from this mine, but it seems that their fond anticipations have had a wet blanket thrown over them. It is said that the San Francisco Trustees have instructed the Superintendent to have no more rock crushed. The question now agitating the public mind of Alpine is: "Has the 'freeze out' game commenced?"

THE BEST BOOK

—FOR—

MINERS, PROSPECTORS AND MILLMEN.

Nevada & California Processes

—OF—

SILVER AND GOLD

EXTRACTION,

For General Use,

BY GIUDO KÜSTEL,

Mining Engineer and Metallurgist—Formerly of the Ophir Works,

IN ONE HANDSOME OCTAVO VOLUME.

SYNOPSIS OF THE WORK.

PART FIRST.

Chapter 1st—Treats of the methods of recognizing silver and gold ores, and contains a "Systematic Proceeding" for their determination by blowpipe analysis readily learned and practised, and is a reliable and accurate guide.

Chapter 2d—Is a description of gold and silver ores, describing many interesting occurrences in minerals belonging to the Comstock, Gold Hill, Humboldt, and Arizona Mining Districts.

Chapter 3d—Describes the requisites and approved methods for testing and assaying—with illustrations.

Chapter 4th—Speaks chiefly of the extraction of gold, especially the amalgamation treatment of ores in batteries, pans and arrastras: and also the extraction of gold by chlorination.

Chapter 5th—Is replete with valuable information on the extraction of silver, including divisions of processes employed. The behavior of chemicals by the wet process; the same when calcined—with valuable hints to attendants roasting ores. Full description for the cold and melting processes, etc.

Chapter 6th—Makes mention of the most modern utensils and machinery, such as pans, agitators, furnaces, etc., with comprehensive diagrams.

PART SECOND.

ON GENERAL METALLURGY.

Chapter 1st—Treats of many species of argentiferous ores; the dry assays of rich and poor ores; also, the same by the humid and dry methods.

Chapter 2d—Presents a clear and comprehensive description of the extraction of silver either by melting or amalgamating process—its dissolution and final precipitation—with divisions of the principal modes of extraction employed.

Chapter 3d—This last chapter gives full and precise formulas for the extraction of the metals in the dry way; the various modes employed in Europe and South America.

The "Amalgamation in pans" with chemicals, or dry method by calcination or roasting ores, forms the most valuable portion of the work; the same being thoroughly and distinctly described and explained, and particularly designed for the treatment of ores in Lower California, Arizona, Mexico, and other mining districts where argentiferous lead ores abound. No less valuable and important are the practical descriptions and illustrations of cupellation and refining of silver, and concentration of the same in lead, by the Parkinson and other processes.

This Work is invaluable to Prospectors, Miners, Metallurgists and Mill-men throughout the Pacific States, containing valuable formulas for the treatment of ores and minerals, expressly prepared in an authentic manner and a plainly written style, for persons engaged in mills in California, Washoe, Lower California, etc. It is also valuable to prospectors and miners unacquainted with mineralogy, having a full and clear chapter on Blowpipe Assays and Tests.

ASSAYERS

Desirous to commence an ASSAY OFFICE in the mines may buy, at a very low figure, in a prosperous mining county, a complete set of Assaying Apparatus, Scales, Chemicals, and everything necessary to carry on said business. Apply to Lock Box No. 782, Postoffice, San Francisco, stating name and where an interview may be had. 17v10

FIRST PREMIUM

FOR REFINING COAL OIL,

At the Mechanics' Institute Fair, 1864.

The PIONEER PETROLEUM OIL WORKS CO. is now ready to advance money upon every kind of Mineral Oil, from five to one hundred thousand gallons, upon assays certified to by Professor E. Benoist. Office Hours—Before 10 o'clock A. M., or between 2 and 4 P. M.

E. BENOIST, Engineer and Chemist,

17v10 643 Third Street, bet. Brannan and Townsend.

EUROPEAN

METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the ore called "rebellions ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

S. P. KIMBALL, J. R. MURPHY.

[Successors to W. H. Irwin.]

No. 205 Third Street, near Howard,

18-v9 SAN FRANCISCO.

A Persevering Oil Hunter.—The Parkersburg *Gazette*, of West Virginia, mentions the arrival of the great oil-prince, Henry D. Sherman, and gives the following particulars:

"Five years since he commenced with little capital and hand manual labor to seek for oil in Pennsylvania. He sunk five wells, all of which were failures. This exhausted his funds, but he did not despair. He tried again—pawning his watch and clothing even—to get means to go on with another well. This well, before completed, reduced him to poverty, and yet he managed to sink his well with his own hands until he struck oil in such large quantities as to make famous over the world the Sherman well. This well flowed at first 2,500 barrels per day, and averaged for over a year a flow of 1,500 barrels. About this time he sold the well for $2,800,000. Since that time, by judicious purchases and sales, he has added to his capital until he is now reported worth $7,500,000, all in cash and equivalent stocks outside of oil lands and oil companies.

Infection by Coin.—Robt. Barnes, Esq., President of the State Bank of Missouri, and D. S. Robinson, Esq., Cashier of the same bank, says the *Republican*, have both been prostrated recently with small-pox, having caught the infection, as is supposed, from handling money which had before been in the hands of persons who had the disease.

Will Make it to Order.—A man advertises in one of the papers for a situation to make Madeira wine in this city. Here's a chance for some enterprising vintner who wishes to sell pure Madeira wine, all the way from San Francisco, California!

A woman recently died in Yorkshire, Eng. who was 105 years old. Her mother was 106 when she died, and her grandmother reached the age of 140 years.

BLASTING

POWDER.

THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequaled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting machinery of the most approved construction, Flour, Saw and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

A SMALL AFFAIR.—The Emperor of Russia contemplates giving, during the present Summer, one of those grand reviews of the cream of all his troops, which will, it is thought, greatly astonish the world, as in olden times. "But," says an English paper, "sixty or a hundred thousand men no longer have that large significance and exceptional character they had in former days when people had not heard of the giant armies of America, which meet in hundreds of thousands, and after the resting of a few days do battle in replenished strength."

A METHOD of coating with a varnish hard as stone has been recently introduced in Germany; the ingredients are forty parts of chalk, forty of rosin, four of linseed oil; to be melted together in an iron pot. One part of native oxyd of copper and one of sulphuric acid are then to be added, after which the composition is ready for use. It is to be applied hot to the wood with a brush, in the same way as paint, and, as before observed, becomes exceedingly hard on drying.

THE WHEAT CROP.—The Santa Cruz *Sentinal* says: From all parts of the county and along the cost, we learn that the wheat crop will be more than an ordinary yield. At first the head did not seem to fill well with grain, but after the latter rains the grains formed plump and full.

HANSCOM'S CRUSHERS,

Made in sizes suitable for Breaking Quartz for Batteries; Rock for macadamizing or concrete; Copper Ore for sacking, sampling, or concentrating; also, for crushing Quartz for Arastras and Griinders. The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water, or Steam Power. For further information address W. W. HANSCOM.

1 Golden State Iron Works, San Francisco.

HUNT'S PATENT

Circular Sweep Horse-Powers,

For running Churns, Washing Machines, Grindstones, pumping water, sawing wood, and other light machinery. Price, $100, at the Factory.

HUNT'S PATENT SELF-REGULATING TREAD HORSE-POWER is superior to any machine of the kind in the market. Price, with Governor, all complete to set to work, at the Factory, $300. Manufactured by

E. O. HUNT,

17v10 28 Second street, San Francisco.

THE HAMMER QUARTZ MILL.

[PATENT APPLIED FOR.]

This Machine is now complete and ready for sale. In constructing it, our aim has been to produce a light, cheap and economical Crusher—one adapted to mining on a small as well as on a large scale.

The elementary principle on which it operates is that of the stamp—the only one really reliable and economical.

But the stamp has many serious disadvantages, among which are its great weight and small velocity; the great power required to run it; difficulty in feeding properly; imperfect discharge, and the necessity of crushing wet, or the annoyance from dust in crushing dry.

All these difficulties are obviated in our machine, and the percussive blow of the stamp retained, with the further advantage of its being a drawing or grinding one.

We give to our hammers such absolute or relative weight and velocity as we choose—just such as to effect their purpose and no more—thus securing the qualities of the natural hammer blow.

The feed is self-adjusting and uniform, and as fast as the ore reaches the required degree of fineness (which depends upon the fineness of the screen or sieve used), it is instantly discharged, so that there is no packlug of the ore under the hammers.

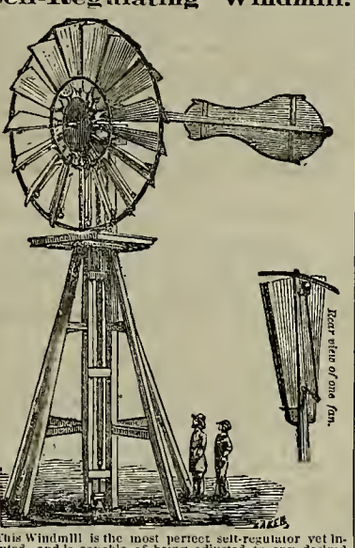
The mill crushes dry, with no more dust than that incident to feeding, which is trifling.

As the only support of the mortar is a single post set into the ground, the machine can be put in place at slight expense.

The size now being built weighs about 1,800 pounds complete; the heaviest piece not weighing over 275 pounds. It is driven by half a horse-power, and crushes from three to ten tons per day of twenty-four hours per day, according to the character of the rock and the fineness to which it is reduced.

PRICE,.....$800.

Larger ones will be furnished if desired.



We invite an inspection of the Mill now in operation adjoining the Foundry of DEVOE, DINSMORE & CO., on Fremont street, between Market and Mission, San Francisco.

Office, No. 11 Court Block, San Francisco, Cal.

21v10 **RIX & LOGAN.**

ATWOOD'S

Self-Regulating Windmill.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,

SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

HUNT'S

IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN

HORSE POWER

For Sawing Wood,

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

SALMON'S

PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this amalgamator, and assayed by Miller & Lunbaum, at Austin, Nevada:

No.	Fine		No.	Fine
Assay	250	Assay	300	990
Assay	285	Assay for Czotman		980
Assay	286	Assay Water Rock		966
Assay	291	Assay Water Rock		998
Assay		St. Helena Ledge, W. D.		966

These, including a hundred other batches, were all worked to within fifteen per cent., and some to within ten per cent., of the assay. Parties interested will find it to their advantage to call and see the above machine in operation.

Manufactured at the San Francisco Foundry, San Francisco, California, by

J. & W. C. SALMON,

To whom all orders should be addressed. 15

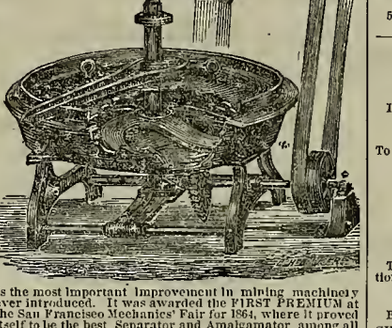
TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.



The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,

At the Novelty Iron Works, Nos. 37 & 39 Fremont street. 15-1m

BAUX & GUIOD'S

Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgamators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

Lapidaries' refuse, Refiners' ashes, Jewelers' sweepings, purchased or worked for a percentage. Ores and tailings worked or assayed at reasonable rates.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8

FARRAND'S

Oscillating Amalgamator,

RECEIVED THE

ONLY PREMIUM

AWARDED FOR AMALGAMATORS

At the Recent Industrial Fair

OF THE

Mechanics' Institute of San Francisco.

Committee of Awards.

O. BELDEN,	W. T. GARRATT,	H. P. WAKELEE,
O. GORI,	GEO. JOHNSON,	C. M. RADCLIFF.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall, and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, whilst the loss by trituration is comparatively nothing.

4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.

5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY.

W. D. FARRAND, Inventor,

R. L. OGDEN, Agent, SAN FRANCISCO.

S. E. corner Montgomery and California streets.

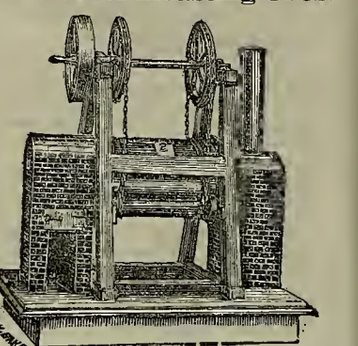
19v9

NOTICE TO MINERS.

NEW QUARTZ MILL.

THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fitchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Freiberg Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard



Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast amalgamate, assort, cupelate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, Metallurgist. **B. FAUCHERY,** Engineer,

24v9

WM. BRUCKNER'S

Furnace for Roasting Ores.

Now in Operation at 416 Market street.

This Furnace, which is portable, and can be carried on mule back, undertakes to roast without employing any labor whatever for the operation of stirring, which is accomplished by machinery that may be driven by steam or any other motor. It consists of an iron cylinder, which, being suspended by chains, in rotating mixes and stirs the ore, by an internal apparatus, quicker and more perfectly than can be done in any other furnace hitherto known in metallurgy. It can be applied to any kind of ore, and the rapidity and perfectedness of its operation, the great saving in fuel, and the entire saving of the labor usually required for stirring the ore, together with the small cost of constructing it, renders this furnace a most

Economical and Practical Invention.

The Furnace may be had of two sizes—one being nine feet in length and building fourteen hundred pounds, and the other six feet in length, and holding eight hundred pounds. One horse power is required to drive the machinery of the larger sized furnace, and three-fourths of a horse-power for the smaller size. Parties wishing to erect such furnaces will please communicate to

W. BRUCKNER,

5v10 No. 416 Market street, San Francisco.

BLAKE'S

QUARTZ BREAKER

Is now extensively used for breaking hard masses of

Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

CALIFORNIA, AUSTRALIA,
WASHOE,
ENGLAND, FRANCE,
— AND —
THE ATLANTIC STATES.

These Machines, or circulars containing further information regarding them, may be obtained of the undersigned. Address,

BLAKE & TYLER,

Box 2077 San Francisco Post Office.

CHAS. T. BLAKE, Idaho City. E. TYLER, Michigan Bluff. WM. P. BLAKE, San Francisco.

4v10

VARNEY'S

PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setlers for themselves, at the **PACIFIC FOUNDRY,**

1v10 San Francisco.

Hepburn & Peterson's

AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. The fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phoenix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant St. bet. 3d and 4th.

[Illustrated in the Mining and Scientific Press, April 9th, 1864.] HEPBURN & PETERSON.

New Mining Advertisements.

Cherokee Gold and Silver Mining Company, Echo District, Humboldt County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 23d day of June, 1865, an assessment of seventy-five (75) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, northeast corner Montgomery and Jackson streets, San Francisco.

Any Stock upon which said Assessment shall remain unpaid on Saturday, the 29th day of July, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 12th day of August, 1865, to pay the delinquent Assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

L. FRANCONI, Secretary.

Office, northeast corner of Montgomery and Jackson streets, San Francisco. je24

Garcia Petroleum Company, Garcia District, Mendocino County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 22d day of May, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificates.	No. Shares.	Amount.
J J Crawford	not issued	438	$219 00
J G Morse	not issued	626	313 00
Geo E Webber & Co	not issued	321	160 50
T J Oneal	not issued	98	49 00

And in accordance with law, and an order of the Board of Trustees, made on the 22d day of May, 1865, so many shares of each parcel of said stock as may be necessary, will be sold, at public auction, by Edwards, Olney & Co., at No. 626 Montgomery street, San Francisco, on the 8th day of July, 1865, at the hour of 11 o'clock A. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

D. S. CUTTER, Secretary.

Office, Room 28 Government House, corner Washington and Sansome streets, San Francisco. je24

Hanscom Copper Mining Company, Low Divide District, Del Norte county, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 19th day of June, 1865, an assessment of fifteen (15) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary.

Any stock upon which said Assessment shall remain unpaid on Saturday, the 22d day of July, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the 5th day of August, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

S. S. SWEET, Secretary.

Office, 602 Market street, San Francisco. je24

Mountain Mary Gold and Silver Mining Company, Silver Mountain District, Alpine County, Cal.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 22d day of May, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

"Say, why should man for thirst be given
If not for wine bestowed by Heaven
To quench such drought as mine?
Without it, I'm a fish on land,
A barren heap of parching sand—
Then give me joyous wine."—*Trinkliel.*

Delicacy of flavor, exhilaration without intoxication, and every other desirable property belonging to the rightly fermented Juice of the Grape, are to be found in the "Gerko Wine," from the celebrated Basquejo Vineyard, Tehama county.

There is no wine produced in California that can bear comparison with this, and it would be difficult to find a European wine, of the same class, that can surpass it.

The vintage of 1862 is now offered for sale, in quantities to suit, by the Agent of the vineyard,

A. S. LOWNDES,

THE NEW LINE TO CHINA.—In view of the new steam line to be opened between San Francisco and China, some information in regard to the distance from point to point on the route will be of interest:—

The distance from San Francisco to the southeastern point of the Japanese Island of Matsmai, which has been spoken of as a good place at which to touch, is 4,100 miles; to Capo Awa, at the south end of Niphon, is 4,474 miles; from San Francisco to Honolulu 2,100 miles, and to Bonin, 3,200 miles. The whole distance to Shanghi through the straits of Natsmai is 5,373 miles, or about twenty-one days steaming at 250 miles per day. This line once established, ninety days will be sufficient to make the circuit of the globe. As compared with the old routes nothing will be experienced from the typhoons of the China sea, the hurricanes of the Bay of Bengal, or the fearful storms which prevail in the straits of Malacca.

DREAMS OF THE BLIND.—The dreams of those born blind are very curious; but they have much difficulty in describing the sensations they experience during sleep. Dr. Blacklock describes it thus: "When awake he could distinguish persons in three ways: by hearing them speak, by feeling their heads and shoulders, or by attending, without the aid of speech, to the sound and manner of their breathing. But in sleep the objects which presented themselves were more vivid and without the intervention of any of the three modes."

D. S. CUTTER. W. H. TOBEY.

PETROLEUM

ASPHALTUM and COAL

AGENCY.

WM. H. TOBEY & CO.,

San Francisco,

Having completed their arrangements with parties in the East, as well as those on this Coast, are now prepared to enter into the purchase, sale or lease of

PETROLEUM, ASPHALTUM AND COAL LANDS,

—ALSO—

COPPER, GOLD AND SILVER MINES,

LIBERAL advancements made on CRUDE PETROLEUM and COPPER ORES. We are also prepared to supply all BORING APPARATUS, TUBING, STEAM ENGINES, BARRELS for shipping Oil, etc., of the latest and most approved patterns.

Experienced Artesian Well Borers and help furnished at the shortest notice.

Persons at a distance wishing to send orders, receive information or subscribe for stock, will save time and money by communicating with us, as we are in constant communication with the most reliable houses and experienced persons at the East.

Parties owning Oil Lands or knowing where there are good prospects, will do well to write or meet us at our office. All communications strictly confidential.

We have now on our Books descriptions of Oil Lands which were selected by experienced chemists. Companies will be organized and incorporated under the laws of the State of California.

Samples from all PETROLEUM and COAL MINES on the Pacific Coast are solicited for our Laboratory.

Best of references given.

☞ *All business connected with Petroleum and Coal Mines* will be promptly attended to. Address

Office: At W. H. Tobey & Co.'s Petroleum Agency, Room No. 28 Government House, SAN FRANCISCO.

This Company issues none but UNASSESSABLE STOCK. This Company's ground is developed by a special fund, derived from sales from a reserved amount of stock set apart by the Company for such a purpose

This Company has secured SIX HUNDRED AND FORTY ACRES OF LAND, in Tulare county, California, in the midst of one of the most valuable oil regions on the continent. One of the largest flowing oil springs in the State is located upon the ground, over a large extent of which oil may be found by sinking open shafts to the depth of ten or fifteen feet.

The lands were selected by the same parties who assisted in locating the well known "Buena Vista Petroleum Company," which company it adjoins on the south.

One hundred gallons of crude oil have already been received in this city from the Buena Vista Company, upon whose grounds a flowing well has been struck at a depth of fifty feet. This oil may be seen at the laboratory of Prof. E. Benoist, at 643 Third street, San Francisco. From it has been distilled as pure an article of kerosene as can be found in the city, samples of which can be seen at the office of the "FIRST NATIONAL PETROLEUM COMPANY," Room No. 20 Government House, in this city.

DEVELOPMENT.

The Company has already entered into a contract with parties who will start the coming week with suitable tools for developing the property. The Company rests its claim to confidence solely upon the intrinsic value of its property, and feels the utmost assurance that its development will realize their most sanguine expectations, and enable it to take rank, at an early day, as a dividend-paying concern.

We would again call the attention of the public to the fact that when you have purchased stock in this Company there can be no assessments coming upon you—that no "freezing out" can be attempted by large stockholders upon smaller ones.

THE CONTINGENT FUND,

From which all expenses are paid, is derived from sales of a reserved fund of ten thousand shares of unassessable stock, whose par value is $50,000. The prospectus and map of the Company's location can be had on application to the Secretary, at his office, Government House, corner Sansome and Washington streets, San Francisco.

Only two thousand shares of the contingent fund is now the only stock in the market for sale, and the proceeds derived therefrom will be appropriated for the purpose designed. The Company are sanguine that they will be able to produce oil in this market from a flowing well upon their claim inside of six weeks, upon which accomplishment there is every reason to believe that the stock will be worth its par value.

San Francisco, April 7, 1865. 14v10

JOHN TAYLOR & CO.,

—IMPORTERS AND DEALERS OF—

ASSAYERS' MATERIALS,

Druggists' & Chemists' Glassware,

HOMESTEAD

FOR FIVE DOLLARS.

There being so many persons who were unable to get one of our HOMESTEAD LOTS in the

New City of Newport,

At the time of our Excursion on the 11th of June, 1865, the Directors have voted to sell

ONE HUNDRED LOTS MORE

At the same price, which is FIVE DOLLARS EACH, and

No Charge for the Deed.

☞ Office Newport Land Company, No. 511 Sacramento street, where plans can be seen and lots selected. 24v10-1m

A Valuable California Invention.

IMPORTANT TO OPERATORS AND DEALERS IN PETROLEUM, ETC.

CALIFORNIA

HERMETICALLY SEALED BARRELS,

—FOR—

TRANSPORTING CRUDE PETROLEUM, KEROSENE, AND OTHER VOLATILE OILS.

WM. H. TOBEY & CO., having purchased the sole right of the United States and Territories to make and vend the above Barrels for the period of ten years, we are now prepared to enter into contracts with parties desirous of using such Barrels, to furnish the same, in any quantity, and at short notice. Samples may be seen at the office of Wm. H. Tobey & Co., Petroleum Agency, Room 28, Government House, San Francisco.

The above invention consists of a simple but effective preparation, which can be applied as a coating to any ordinary barrel of pine or hard wood, by which the same is rendered perfectly impervious to the most volatile substance known, thus rendering an ordinary barrel quite as safe a receptacle for Petroleum as a metal case, and at far less cost. Orders received as above by

WM. H. TOBEY & CO.

And in accordance with law and an order of the Board of Trustees, made on the 5th day of May, 1865, so many shares of each parcel of said stock as may be necessary will be sold, at the Secretary's office, on the 26th day of June, 1865, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

W. FELL, Secretary.

je10 Office, No. 53 Montgomery Block, San Francisco.

POSTPONEMENT.—The above sale is hereby postponed until Thursday, July 6th, 1865, at the same hour and place. By order of the Board of Trustees.

je24 W. FELL, Secretary.

Caledonia Tunnel and Mining Company, Gold Hill District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 9th day of June, 1865, an assessment of three dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, No. 10 Government House, corner of Washington and Sansome streets, San Francisco or to James V. Coffey, Virginia, Nevada.

Any stock upon which said assessment shall remain unpaid on Saturday, the 15th day of July, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, July 29th, 1865, at 12 o'clock M., to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

je10 J. M. BUFFINGTON, Secretary.

Annual Meeting.

The stockholders of the First National Petroleum Company are hereby notified that a meeting of the Company will be held at the Company's office, for the election of a Board of Trustees, on Saturday, the 24th inst., at 2 P. M.

je17 D. S. CUTTER, Secretary.

El Dorado Gold and Silver Mining Company, Silver Mountain District, Alpine county, California.

ASSESSMENT No. 5.—Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 5th day of June, 1865, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company.

Any stock upon which said assessment shall remain unpaid on Saturday, the 15th day of July, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 31st day of July, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.
W. D. ROOT, Deputy Secretary.

Office, No. 410 Montgomery street, San Francisco.

NOTICE.—At the above meeting, assessment No. 1, levied July 8th, 1863, assessment No. 2, levied August 4th, 1863, and assessment No. 3, levied October 15th, 1863, of ten cents per share each; also, assessment No. 4, levied September 24th, 1864, of fifty cents per share, were rescinded, and stockholders having paid said assessments will be credited on the above assessment, No. 5, accordingly. Also, notice is given, that the additional amount of twenty cents per share (being properly assessment No. 5), was levied for the month of June, 1865.

J. WARREN CLARK, Secretary.
je10 W. D. ROOT, Deputy Secretary.

El Alamo de San Antonio Mining Company, San Antonio Mining District, Lower California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held December 6th, 1864, an assessment of one ($1) dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, 514 Bush street, San Francisco. Assessments paid on or before the 20th instant, ten per cent. will be allowed on the amount so paid.

Any stock upon which said assessment shall remain unpaid on Tuesday, the 3d day of January, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Tuesday, the 17th day of January, 1865, to pay the delinquent Assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

THOMAS RUTHERFORD, Secretary.

SUPPLEMENTARY NOTICE.—In consequence of an omission to advertise the delinquent stock on the above assessment on the day set forth—namely, the 3d day of January, 1865—the said assessment is hereby re-published, as by law provided; and in accordance therewith, any stock upon which said assessment shall remain due and unpaid on Saturday, July 1st, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, July 15th, 1865, to pay said delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

THOMAS RUTHERFORD, Secretary.
San Francisco, May 27, 1865. my27-td

Notice is hereby given, that at a meeting of the Trustees of said Companies, held on the 1st day of June, 1865, an assessment of ten (10) cents per share was levied upon the capital stock of each of said Companies, payable immediately, in United States gold coin, to the Secretary, at his office, 305 Montgomery street.

Any stock upon which said assessment shall remain unpaid on the 1st day of July, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on the 20th day of July, 1865, to pay the delinquent assessment, together with the costs of advertising and expenses of the sale.

J. S. LUTY, Secretary.
305 Montgomery street.
San Francisco, June 1, 1865. je3

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The PRESS contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

DEWEY & CO.,
Publishers and Job Printers,
Office Mining and Scientific Press, San Francisco.

A Curious Oil Well.—The Eagle well, in Indiana County, (Penn.,) owned by a company in Harrisburg, is being pumped at a depth of one hundred and forty-two feet. The singular feature of this well is that the oil cannot be separted from the water. Both fluids are apparently of the same specific gravity, and though easily distinguishable, they cannot be separted. The oil appears diffused throughout the body of the water. It is, when pumped, of a dark verdigris color, and in a few days becomes thick as lard, and inodorous. The company intend to keep at work. The mixture is a puzzle for the chemists.

A private letter says that among Mr. Lincoln's papers has been found a package of letters, marked in his own handwriting "Assassination letters." While many of them threatened his life, others warned him of plots to take it. He seems to have become so used to things of this sort that neither kind made any impression on him.

Two million dollars' worth of tobacco, belonging to Frenchmen, was burnt at Richmond by the Rebels.

MINING LAWS AND FORMS.

Third Edition revised and enlarged.

Compiled by H. B. CONGDON.

THIS Edition contains all the laws of the *STATE OF CALIFORNIA* and *NEVADA TERRITORY*, relative to Mining Corporations together with the Mining Ordinances of Mexico, complete; Digest of Decisions of the Supreme Court; Forms etc. 16 mo. flexible cloth, 192 pp. $2.50.

Published by H. H. BANCROFT & CO.

U. S. 7-30 LOAN.

By authority of the Secretary of the Treasury, the undersigned has assumed the General Subscription Agency for the sale of United States Treasury Notes, bearing seven and three-tenths per cent. interest per annum, known as the

SEVEN-THIRTY LOAN.

These Notes are issued under date June 15th, 1865, and are payable three years from that time in currency, or are convertible, at the option of the holder, into

U. S. 5-20 Six Per Cent.

GOLD BEARING BONDS.

These Bonds are now worth a premium of nine per cent. including gold interest from November, which makes the actual profit on the 7-30 loan, at current rates, including interest, about ten per cent. per annum, besides its EXEMPTION FROM STATE AND MUNICIPAL TAXATION, WHICH ADDS FROM ONE TO THREE PER CENT. MORE, according to the rate levied on other property. The interest is payable in currency, semi-annually, by coupons attached to each note, which may be cut off and sold to any bank or banker.

The interest amounts to

One cent per day on a $50 note,
Two cents per day on a $100 note,
Ten cents per day on a $500 note,
Twenty cents per day on a $1,000 note,
One dollar per day on a $5,000 note.

Notes of all the denominations named will be promptly furnished upon receipt of subscription. This is

The only Loan in Market

now offered by the Government, and it is confidently expected that its superior advantages will make it

THE GREAT POPULAR LOAN OF THE PEOPLE.

Less than $300,000,000 of the loan authorized by the last Congress is now on the market.

This amount, at the rate at which it is being absorbed, will all be subscribed for within four months, when the notes will undoubtedly command a premium, as has uniformly been the case on closing the subscriptions to other Loans.

In order that citizens of every town and section of the country may be afforded facilities for taking the Loan, the National Bank, State Banks, and Private Bankers throughout the country have generally agreed to receive subscriptions at par. Subscribers will select their own agents, in whom they have confidence, and who only are to be responsible for the delivery of the notes for which they receive orders.

JAY COOKE,
Subscription Agent, Philadelphia.

March 25, 1865. 17v10 3m

ADDENDUM.

PER OVERLAND TELEGRAPH:

PHILADELPHIA, May 17, 1865

Second Series all sold. Commenced on Third Series. Two Hundred and Thirty Millions (230,000,000) precisely like other two Series, except dated 15th July, and Government reserves the right to pay six per cent. in Gold instead of 7-30 Currency.

JAY COOKE,
Subscription Agent, Philadelphia.

HELMBOLD'S

FLUID EXTRACT BUCHU

For Non-Retention or Incontinence of Urine, Inflammation or Ulceration of the Bladder or Kidneys, Diseases of the Prostrate Gland, Gravel, Brick Dust Deposits, Dropsical Swellings, Organic Weakness, Debility, Female Complaints, Etc.

H

HELMBOLD'S

FLUID EXTRACT BUCHU

—AND—

Improved Rose Wash

Will radically exterminate from the system Diseases arising from Habits of Dissipation, *at little expense, little or no change of diet, no inconvenience or exposure;* completely superseding those *unpleasant and dangerous remedies, Copaiba and Mercury,* in curing these diseases.

E

USE HEMBOLD'S

FLUID EXTRACT BUCHU

In all Diseases of the Urinary Organs, whether existing in MALE OR FEMALE, *from whatever cause originating, and no matter of how long standing.* It is pleasant in its taste and odor, IMMEDIATE in action, and more strengthening than any of the preparations of *Bark or Iron.*

Those suffering from *Broken Down or Delicate Constitutions, procure the Remedy at once.*

The reader must be aware that however slight may be the attack of the above diseases, it is certain to affect his *Bodily Health, Mental Powers and Happiness.* If no treatment is submitted to, Consumption or Insanity may ensue.

All the above diseases require the aid of a diuretic.

Hembold's Extract Buchu

IS THE GREAT DIURETIC.

L

HELMBOLD'S

HIGHLY CONCENTRATED

Compound Fluid Extract Sarsaparilla,

For purifying the Blood, removing all diseases arising from excess and imprudence in life, chronic constitutional diseases arising from an impure state of the blood, and the only reliable and effectual known remedy for the cure of Scrofula, Scald Head, Salt Rheum, Pains and Swelling of the Bones, Ulcerations of the Throat and Legs, Blotches, Pimples on the Face, Tetter, Erysipelas, and all scaly eruptions of the skin, and beautifying the COMPLEXION.

M

NOT A FEW

Of the worst disorders that afflict mankind arise from the corruption that accumulates in the Blood. Of all the discoveries that have been made to purge it out, none can equal in effect HELMBOLD'S CONCENTRATED EXTRACT OF SARSAPARILLA. It cleanses and renovates the Blood, instills the vigor of health into the system, and purges out the humors which make disease. It stimulates the healthy functions of the body, and expels the disorders that grow and rankle in the Blood. Such a remedy, that could be relied on, has long been sought for, and now, for the first time, the public have one on which they can depend. Our space here does not admit of certificates to show its effects, but the trial of a single bottle will show to the sick that it has virtues surpassing anything they have ever taken.

B

Two tablespoonsful of the Extract of Sarsaparilla, added to a pint of water, is equal to the Lisbon Diet Drink, and one bottle is equal to a gallon of the Syrup of Sarsaparilla, or the decoction as usually made.

The above Extracts are prepared on purely scientific principles—in *Vacuo*—and embody the full strength of the ingredients entering into their composition. A ready and conclusive test will be a comparison of their properties with those set forth in the U. S. Dispensatory.

O

HOW TO USE THE REMEDIES.

In Diseases of the Blood, Humors on the Face, or any and every part of the body, use Extract of Sarsaparilla, applying to Pimples and all external Humors or Eruptions the Improved Rose Wash.

Use the Extract Buchu for all diseases requiring the aid of a diuretic, except those of the Urinary Organs, such as Gonorrhœa and Gleet; in these use the Extract Buchu, and inject with the Improved Rose Wash.

L

☞ THESE EXTRACTS HAVE BEEN ADMITTED TO USE IN THE UNITED STATES ARMY, and also are in very general use in all the STATE HOSPITALS AND PUBLIC INSTITUTIONS throughout the land, as well as in private practice, and are considered as invaluable remedies.

SAVE YOUR BOILERS AND FUEL.

ONE-EIGHTH OF AN INCH OF DEPOSIT ON THE fire surface of a boiler takes THIRTY PER CENT. of the steam generating power from that boiler, and, of course, wastes thirty per cent. of the fuel; and, what is a greater misfortune, it keeps the water from the plates and flues, causing them to scorch, blister and burn, destroying the boiler, and too often human lives.

I Have a Compound For Sale

That I have used with complete success in every instance, and without delaying the running of machinery, or injuring the boilers in any manner, and at a cost of five dollars the boilers can be made as clean as when they were new.

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

Principal office, Brandreth Building, New York.

W. F. BRANDRETH.

10v2tf Office at Crane & Brigham's San Fran.

WE ARE NOW OFFERING OUR IMMENSE STOCK

—OF—

FINE CUSTOM MADE CLOTHING

—AND—

Gents' Furnishing Goods

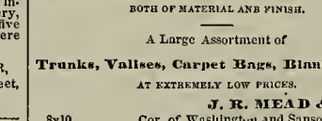
AT PRICES THAT DEFY COMPETITION.

Our Stock of Clothing Consists of

ALL THE LATEST STYLES

BOTH OF MATERIAL AND FINISH.

A Large Assortment of



Trunks, Valises, Carpet Bags, Blankets, Etc.,

AT EXTREMELY LOW PRICES.

J. R. MEAD & CO.,

8v10 Cor. of Washington and Sansome streets.

TRY

Ward's Perfect Fitting Shirts.

These Shirts are too well known to need any comment, both for perfect fit and quality. A large supply always on hand. Also, the largest stock of Gents' Fine Furnishing Goods on the Pacific Coast. Try one of his Shirts, and you will never wear any others.

STOCKTON WATER WORKS.—Workmen are now engaged in taking up the wooden water pipes of the Stockton Water Works and replacing them with more enduring ones of iron.

WHEELER & RANDALL'S TRACTORY GRINDERS AND AMALGAMATORS.

We give annexed two representations of the differently constructed tractory grinding pans, recently invented and put into use by Messrs. Wheeler & Randall, of this city. Fig. 1 represents the pan with the greater base of the conoid? or grinding surface, upward; while fig. 2 represents the greater base downwards. The principle upon which these pans are constructed is well known to our readers, as the same has been fully discussed in recent issues of the MINING AND SCIENTIFIC PRESS. Our present purpose is to give a few words of general explanation with regard to its working, etc., in connection with the accompanying illustrations.

The chief and most important object sought, has been to procure a uniform grinding surface, which shall wear equally and evenly throughout its entire extent. The discussion referred to has proven, to a *mathematical* demonstration, that the tractory conoid surface accomplishes this. A *practical* demonstration of the correctness of this principle was made several years ago, by Mr. Schiele, of Oldham, England, who constructed a flouring mill on the tractory principle, and proved by practical demonstration, to use his own language, "that a two-foot runner (constructed on the tractory principle,) produces as much flour as a four-foot flat mill-stone, the power required being a minimum." The above result appears to be fully sustained by practical tests of the Wheeler & Randall pan, as reported by Mr. Johnson, foreman of the Bacon Mill, at Silver City, Nevada, in which mill several of these pans are employed. A secondary object is gained in these pans, by the employment of open mullers. as at 0, 0, in fig. 2, whereby the pulp is more readily and repeatedly subjected to the action of the grinding surfaces than has hitherto been obtained by the disk-formed mullers. Similar openings may be seen, but not lettered, on fig. 1.

In fig. 1, the bulk of the quicksilver remains nearer the center of the pan, and consequently more quiescent; while in fig. 2 it is found at the circumference, where it is more agitated; but, on the other hand, by the action of the mullers in this pan, the pulp, and with it the gold, is thrown violently, by centrifugal force, directly into the body of the quicksilver, with a greater certainty of being retained there. The opinion of miners being somewhat divided as to the efficiency of these two modes of amalgamation, they have here their choice of manner, while the same degree of grinding efficiency is presented in both.

With regard to the general construction of the pan its various parts and mode of operation, and the additional advantages claimed therefor, we would refer the reader to the advertisement, in another part of this paper.

We would close with a single remark as to the workmanship exhibited in the construction of these pans, which have hitherto been made by the Union and Golden State Foundries alone. The work upon them is unsurpassed by that upon any other pans yet presented, and reflects the highest credit upon the mechanical skill and appliances of those two establishments. Most of the other foundries in the city will be prepared to manufacture them as soon as their patterns are completed.

A FACT.—It appears to be a well-established fact that the French Mission was offered to James Gordon Bennett, of the New York *Herald*, after the death of Minister Dayton.

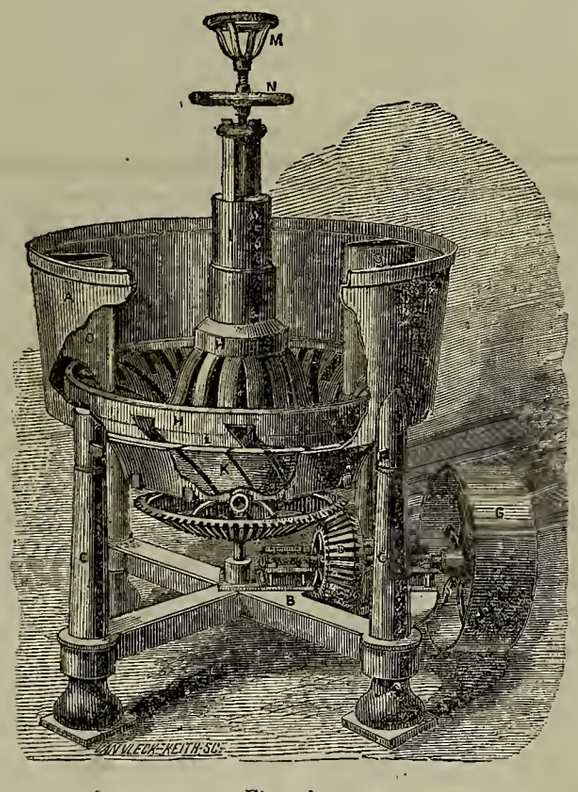

Figure 1.

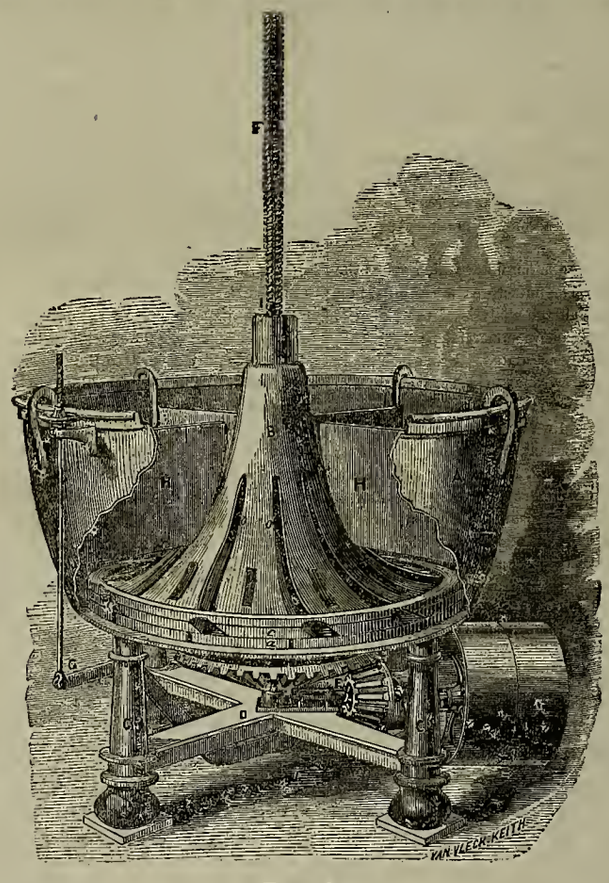

Figure 2.

BACHELOR OF ARTS.—The honorary degree of M. A. bestowed by the California College on Hon. A. A. Sargent was most justly merited. No college walls contain a severer or more persevering student than the Hon. ex-member of Congress.—*Amador Ledger.*

An intimate acquaintance of some fourteen years with Mr. Sargent enables us to fully endorse the above expressed opinion of the *Ledger*.

PRESIDENT JOHNSON.—His policy is to have no policy at all, but to act as the occasion may require to the best of his judgment. He will go straight along in the conscientious discharge of his duties without regard to his political future. So says an old personal friend of the President who has recently had a personal interview with him.

THE IRISH EMIGRATION.—All accounts agree in representing that an immense number of people in Ireland have been only waiting the re-establishment of peace in this country in order to emigrate here. Now that such peace is virtually concluded, no doubt the emigrant ships will be crowded for the coming year, and the Commissioners of Emigration will have their hands full of business in attending to the duties of their office. The *Irish Times*, of a recent date, says: "We believe that when peace ensues between the belligerents in America, the emigration which has hitherto taken place, compared to that which will be, is as the leakage of a weir to the opening of the sluice. There is not a city, town, or hamlet in Ireland, in which a large proportion of the able-bodied population is not determined to emigrate the moment peace is made."

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

THE GEYSER SPRINGS OF CALIFORNIA.

THE QUICKSILVER MINES.

The mountains arouud are impregnated with cinnabar; and native mercury, rieb and pure, may be collected in quantities from the rocky crevices. Some prospectors bave doubted as to the existence of large beds of cinnabar in the St. Helena mountains, but admit that native quicksilver is found in plenty, contained in and interspersed through the creviees of the loose, porous rock, which on breaking, or by concussion, yields myriads of globules, large and small, which are easily collected. Its presence has been accounted for by some, on the ground that the chemical action continually going ou at the Geysers and its vicinage, eaused by the decomposition of irou pyrites, engenders the heat, that rousts the cinnabar, the vapor condensing in the pores aud crevices of the surface rock, and thus the pure quicksilver becomes deposited.

The St. Helena mountains have beea prospected in every direction for many miles, and a hundred or more claims, more or less valuable, especially in a southeast to northwest direction, have been staked off and titles adopted, which to enumcrate, would be found too formidable a list for tbe general reader. Their united capitals (on paper) would amount to many millions of dollars. The Pioneer mine has been sold to a company in New York city. The conveyancc, recorded in Santa Rosa, hears a Federal stamp of $1,000, showing the consideration to have been a million of dollars. This miae, situated on Pine Flat, is located less than two miles from the Geyser Hotel. Numerous other valuable mines are situated in similar proximity.

In short, from tbe variety and quantities of minerals that can be procured in their crude state for tbe purposes of commerce, the Geysers may be aptly termed "Nature's Apothecary Hall."

Of sulphur, the miaeral key which opens the door to chemical manufactures, steep hills, in a crude state, await the analysis of tbe chemist. Its importance as a commercial product cannot be too highly estimated. From it is made sulphuric acid, without which many of the most extensive manufactories would cease to exist. By its aid we are able to produce so many substanccs that an enumeration of its uses would far exceed tbe limits of tbis article. Though the chief ingredient of gunpowder, it is required for a thousand other purposes, ineluding various forms of valued medicines.

Earthquakes have frequently been experienced at the Geysers, accompanied by a large noise. Two smart shocks were felt on the night of the 20th of February, 1863. Those shocks and attending noises were ascribed to the bursting forth of new openings of steam and boiling waters, and about that time a large ledge of rock was found broken off in the Geyser or Devil's Cañon, attributed to the severe oscillations of the earth.

As there is nothiag comparable, as a wonder of nature, in these United States, and for its varied medicinal utility to the Geysers, it must become ultimately the Saratoga of the Pacific coast; and if the new metbod of condensing the waters of mineral springs be adopted which has lately come into sucb favor in Paris, the universal aud medicinal wealth of the Geysers cannot be over estimated. This condensation by freezing enables the owners of medicinal springs to expel from the water the greater part of its aqueous prineipal, while at the same time the medicinal elements remain intact. A single bottle prepared by this method will eontain the medicinal elements of from tea to twenty bottles of the same water as it flows from its origiual source. This simple mode of eoneentratiou is applicable to every species of medieinal spring water, and especially to saline, alkaline, bi-carbonate, sulphurous and chalybeate spring water. It is easily accomplished by Carre's ingenious machine for making artificial ice, universally used in Paris. The water concentrated at one-eightb or one-tenth, and even above this last figure, represents in almost an integral manner the primitive water—the quantity remaining imprisoned in the ice being small. This metbod of concentrating medicinal waters enables the physician to administer to delicate patients, and especially to women and children, the waters of any spring in a very small volume. It would reduce the cost of transportatiou many hundred per cent. It has been observed that the hottest springs are the purest, and Arago, in 1821, discovered that the deeper the artesian well, the hotter became the water. This may show that the boiling springs of tbe Geysers ascend from great depths.

In conclusion, it has been said that the Geyser cañon is a vale of wonders—nature's laboratory, where chemistry is to be studied. Tbe name and number of the springs is "legion;" hot sulphur, warm sulphur, blue sulphur, yellow and white sulphur, alum, salt, borax, ammonia, tartaric acid, epsom salts, magnesia, copper, quicksilver, in its native state, and any amount of mineral compounds. You may stand with one foot in a cold bath and the other in a hot one, if you can bear it. With one hand you may dip up alum water as bitter and pure as chemistry can compound it, and with the other sulphur water that will sicken your very soul. If you have rheumatism, bathe in the splendid sulpbur baths or the Indian spring; if your eyes are weak, use the eye-water, which beats any ever charmed by magical incantations. It is impossible to drill a hole two feet deep in the side of the ravine without provoking a little jet of steam.

"And now, having far exceeded the space I intended to occupy," concludes a traveler, writing of tbis locality, "I will finish by saying that all who with me have climbed the Himalayas in India, seen Saratoga and the White Springs, the Mammotb cave of Kentucky, and the great Niagara in America, visited Bath, Cbeltenham, Malvern and Harrowgate in England, the Giant's Causeway and Fingal's Cave, Scotland and Ireland, and the many spas of Germany, ascended Mount Blanc, crossed the Appenines, topped old Vesuvius and Mount Ætna, beheld the antiquities of Rome, wandered through the halls of the Vatican, roamed through the mighty Colloseum "by moonlight," seen Pisa's Leaning Tower, and Venice, the gem of the sea—I say, that though they may have seen all these wonders, if they have missed the Geysers in California, they have in reality seen *rien de tout*. I have said nothing of the medicinal or healing qualities of the different waters, although the Indians who visit this place every spring declare them to be a certain specific for rheumatism, dyspepsia, opthalmia, diseases of the skin, loss of appetite and constitutional debility; and to the truth of which many visitors can testify. One gentleman I met there, who had expended thousands of dollars in medicines, in vain, remarked that a sojourn there of two months, and drinking the waters, had added ten years to bis life."

THE CAUSES OF THE PHENOMENA.

Before closing our description we would add a few words with regard to the causes which have produced this remarkable valo of wonders—nature's great laboratory, where her chemical operations are conducted on a scale of such wondrous magnitude. One writer has suggested the idea that the phenomena here displayed may be due indirectly to electricity; arguing that if chemical action produces galvanie currents, and those currents create heat, all these boiling, spouting and steaming processes, here observed, may be attributed to that agency. We have seen it stated that Professor Whitney has pronounced the Geysers a smouldering volcano, that may one day deluge the entire region round about with burning lava! In support of this theory we may quote the remarks of one writer who has examined carefully the *salses* or mud volcanoes of South America, and similar phenomena which are not unfrequent on the sides of volcanoes, who says tbat the principle feature of this locality, known as the Witcbes' Cauldron, is almost precisely similar to them in character. Humboldt says these *salses* or mud volcanoes are simply the preliminary indications of a probable increase to powerful aad awful activity, of the streams of lava that are so often seen flowing from volcanie mountains. Other distinguished *savans* have attributed tbe heat to the contact of water with tbe veins in beds of sulphurets or phosphates contained in tbe hills and occurring at no very great distance from the surface. Whatever may be the cause of the remarkable phenomena exhibited at this locality, it will doubtless long continue an object of general euriosity and scientific interest, attracting thither hundreds and thousands of visitors from all parts of the world.

The engines for the cars between Napa and Suscol have arrived, and it is expected that the cars will be running in a few days.

A Cheap Home-Made Gate.—I take five pieces of inch boards, each ten feet long, one of these eight inches wide for the bottom strip. I then take one piece four inches wide for the end piece where the hinges are to be. These end strips are four feet long, that being high enough for any gate for ordinary purposes. Now lay your end pieces, then place the eight-inch wide and ten foot long strip for the bottom, nail it at each end to the up-right with wrought nails; now take three or four inch wide strips, and lay them on a parallel with the bottom one, dividing the spaces so as to leave four inches between the two lower boards, and six inches each space between the upper ones; nail as before Now turn the gate over, and take the remaining strip, lay it at an angle from the bottom, at the hinge end, to the top, at the latch end; cut it so that it will fit in and lay close to the long strip; nail it thoroughly; now hang with strong hinges, and you have a gate that is light, and will not sag, and just as perfect against cattle as one made by a joiner, and costing from three to five dollars. Any person can put together and hang such a gate in two hours.—*Ohio Farmer.*

New and Important Invention.—The Cleaveland *Leader* says that James E. Craig has invented and patented a new steam boiler, which will work an entire revolution to steam boilers of all kinds, and particularly where a large amount of fuel is used, in making a saving of at least nine-tenths of the fuel now required for ordinary boilers. The mode of its operation is to start the fire by the natural draught of air and when the coals are ignited, close the openings beneath the grate and the top of the flue—supplying air for combustion by means of a force pump, which, after passing through the fire, is injected as flame into the substance of the water, which instantly starts the generation of steam, although the mass of the water be not above one hundred degrees Fahrenheit. On trial it was estimated that less than one pound of coal would develop a horse-power for an hour, saving something like nine tenths of the fuel commonly consumed. The boiler, which is only six feet in length and three feet in diameter, developed for several hours, steam enough for a thirty horse-power engine from but a few shovels full of coal. Its main feature is the entire economy of all the heat generated.

Ancient Ship-Building in Advance of Modern.—Capt. G. F. Goble has, during the past week, submitted to us an elaborate series of working drawings connected with wood and iron ship-building, copied from original diagrams found in the Summer Palace of the Emperor of China, and supposed to be many thousands of years old. The construction of the vessel is in every way remarkable, especially considering the great antiquity claimed for it; the hull, masts, sails, screws, etc., being either of a character equal to the most approved arrangement of the present time, or considerably in advance of them. Capt. Goble is seeking the co-operation of a few antiquarians, or others interested in the subject, in order that a working model of the vessel may be built, and there appears to be no doubt that very many material advantages will be gained as compared with any ship at present afloat. Not only are the several portions of the ship itself of the highly efficient character described, but even the chain cables are apparently superior to those now in use, though totally different in construction; they are said to be capable of bearing a strain of 10,000 tons.—*London Mining Journal, April* 22.

Improved Composition Iron.—It appears that a great increase in tensile strength and compactness is given to all the various grades of cast iron by the use of a small per centage of a metallic composition, invented by Mr. W. M. Arnold, of New York, and added in a proper manner. It is said to increase the strength from twenty-five to fifty per cent. so that the weight of many descriptions of castings may be reduced fully one-third, and yet be stronger than if cast in the ordinary manner. The composition has been tested at the Morgan Iron Works, New York, and Wiard Ordnance Works, Trenton, N. J.

The Largest Railway Bridge in the World.—The proposed bridge which is to carry the South Wales and Great Western Direct Railway, in England, across the river Severn, near to Chepstow is, according to the design of Messrs. Fowler and Fulton, the engineers, to be two miles and a quarter in length, and is to have sufficient headway to permit masts of ships of 122 feet in length to pass under when the surface of the river is at the level of mean tide, so as in no way to impede the navigation.

New York is the largest market for sole leather in the world, more being bought and sold in that city than in Liverpool, London and Paris combined. It is estimated that 10,000,000 hides are tanned in this country annually, requiring about 700,000 cords of bark for the operation.

The New Timber Framer.—The new timber framer invented by the Messrs. Hochholzer of Virginia City, and which we noticed on page 338 of the present volume, can now be seen in operation at the Savage mine, Virginia City. The editor of the *Enterprise* describes its working as follows: "We visited the works and saw the machine frame several sticks of timber. It frames both ends of a stick at the same instant, either cutting tennons of the same size at each end, or of very different sizes and lengths. The saws and framing knives make about twelve hundred revolutions per minute. There is a wild old shrieking and humming when the machine begins to walk into the timber. As a visitor aptly but profanely remarked in our presence, after gazing at the machine some time with wildly distended eyes—"it goes like h—l beating tan-bark!" By this machine we saw a stick of timber perfectly framed, ready to be set up in the mine, in just two minutes three-quarters. To have done the same work by hand would have required three hours' time by a good carpenter. Timbers of various length are framed by the machine, and square or covered shoulders are cut with equal facility and precision. The tennons are left as smooth as though dressed with a plane. The machine itself is a beautiful piece of workmanship, and in every part is most ingeniously contrived. The arrangement by which the stick of timber to be operated upon is held and turned upon the saws and knives is particularly ingenious. However much "in wind" or crooked a stick may be makes no difference; it comes out of the machine perfectly framed. It would be the same with a round and rough top, just taken from the forest. Three men—a mechanic to watch the machine and two common laborers—will do as much work with the new framer in one day as could be done in the same time by thirty good carpenters. By the use of this fine inveation the Savage Company will save each day at least $60. The machine now in use, the first ever built, was constructed at the foundry and machine shop of Mead & McCone, at Johntown, below Silver City, and is a credit to their establishment. We understand that a similar machine will at once be built for a Gold Hill company. In less than a year we expect to see one of these machines running at each of our leading mines. All honor to our Washoe inveators!

Horse Power.—Many have but an erroneous idea of the drawing power of a horse. Some, probably, have no idea that approaches correctness. The strength of different horses undoubtedly varies a great deal, but in calculating the power of an engine the horse-power is estimated as equivalent to a force capable of raising or moving 150 pounds twenty miles a day at the rate of two and a half miles an hour. This seems small, but experiments have actually shown the power of the farm horses in this country to be considerably less.

On a level road or floor the horse is ordinarily as strong as five men; but up a steep incline the man has the advantage, for it has been found that a man can rise a steep hill with a load where it would be out of the power of a horse to climb. A man of ordinary strength, placed in a position to exert his strength to the greatest advantage, can apply more power than a horse in drawing from a point two feet above the ground. It requires a heavy pair of horses to exert a force of five hundred pounds, in such a position.

As the horse's speed increases his power of draught diminishes very greatly till it becomes very difficult for him to move his own weight. On soft roads the draught is not so much affected by the speed, and the resistance is very little, if any, greater in a trot than in a walk, but a carraige on a dry hard pavement requires one-half greater force when propelled in a trot than in a walk.

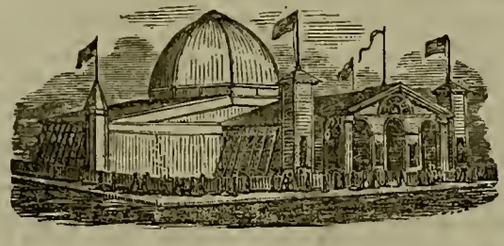
Many say a horse will draw an amount equal to his own weight; but this is not so, except in extraordinarily favorable circumstances. The steady propelling power which he is able to exert is far less. The weight of his own body requires the application of considerable force to move, and this is deducted from the force he is capable of exerting on other bodies.

Quicksilver Mines.—Rumor says that great quantities of cinnabar have been discovered within the last year at New Almaden, in new tunnels and in places very convenient for extraction. Two new furnaces are to be built, implying an increase of twenty-five per cent. in the production; so that we may expect that next year the yield will be 3,000,000 pounds or more. The Josephine mine, in San Luis Obispo county, which promised much at one time, has failed to supply the quality and quantity of ore expected, and is soon to be abandoned, although much expense has been incurred. The Pioneer mine, near the Geysers, according to report, has been sold to a Boston Company, which intends to give it a fair trial.

One Thing at a Time.

One thing nt a time, my dear fellow—one thing at a time. If you attempt to lift both the twins and your wife over the stream at once, you will probably drop the doll of one of the little ones, and the bonnet of the other, and set the wife down ankle deep into the stream. Some men of extraordinary gifts can rock the cradle and read the paper at the same time; but few can stir the hominy and calculate an eclipse at once, without burning the one and postponing the other a year or two. You may put as many irons in the fire as the furnace will hold, if you time them rightly about their coming out. But don't try to hammer out all at once, or attempt to shape an eel spear and a horse-shoe nail at the same blow. A wise builder will have the masons busy here, and the carpenters there, and much work proceeding with equal pace; but he does not draw up the specifications for a new house while he is draughting the plan of another. We may set out a tree that will be growing while we sleep, wind up a clock that will run its round while we run up town on an errand; but we don't see our trees nor wind clocks while running of errands or while asleep.

It is wise to have things so situated that there be no chinks between our jobs; no time wasted in taking up another when one is ended, and that, when really tired of one, we can refresh ourselves by laboring at another. But it is wasteful to turn from one undertaking to another while yet fresh enough to push the first on to a conclusion. One thing at a time, and that thoroughly, is the secret of success in all great attainments. Crowd the inspiration in between narrow banks, too narrow to allow of two jobs to ride abreast, and you can float down it any task you have attemped, though as large among our common labors as a seventy-four is among other ships. But widen the stream to accommodate a score of trifling tasks, and half of them will stick at sand bars and be left for another tide.—*New York Times.*



IDAHO ORES.—The Idaho *Statesman* says: One of the great advantages the mines of Iduho have over those of Nevada, and many of those of California, is the fact that they may be much less expensively worked than those. In almost every instance so far as we have heard, the precious metals are unmixed with the various base alloys, so that no expensive roasting or other process is necessary to be resorted to to work them up to the highest practicable yield. Arsenic, antimony and sulphur are almost unknown, and we have nothing to do but to crush the rock and amalgamate by the simplest process to obtain the best practical working results. This is not the result elsewhere, and this difference in favor of our own mines is an item that ought not to be overlooked by those who are making permanent investments. In a locality so far removed from shops and manufactories, and from any seaport or navigable water, it is of great importance to the miner whether he can erect the simplest kind of crushing and amalgamating machinery, and begin to realize from his work, or whether he must be subjected to all the vexations and expensive delays attendant upon experimenting and reducing refractory ores. The working of the one is attended so far as the experience of our miners goes, with almost unvarying success, while the other has been attended with years of discouragement. These ideas are not thrown out with a view to disparage the claims of any other mines to public favor, but only to set forth the facts in regard to our own.

In the fight of Blakely, below Mobile, a novel implement of war was used, and one which, according to rebel statements, was most destructive. General McArthur had a half dozen mortars made of the wood of the gum tree, and they were used during the whole attack. One shell from a wooden gun is known to have killed and wounded eleven Confederate soldiers, and the rebels assert they were the most destructive guns used. It is designed to send two of these "new fangled" guns to the Chicago Sanitary Commission fair, to see how much they will bring in aid of the soldiers. One hundred shells were fired from one of these mortars.

PARASITES.—Nature descends down to infinite smallness. A great man has his parasites; and if you take a large bazzing blue-bottle fly and look at it in a microscope, you may see twenty or thirty little ugly insects crawling about it, which, doubtless, think their fly to be the bluest, grandest, merriest, most important animal in the whole universe, and are convinced the world would be at an end if it ceased to buzz.

PRESIDENT LINCOLN, before leaving Washington on his last visit to the army, wrote a call for an extra session of Congress, which was signed by both bimself and Secretary Seward, to be issued in case anything happened to him. The document is now on file at the State Department.

THE FIFTH INDUSTRIAL FAIR

OF THE MECHANICS' INSTITUTE OF SAN FRANCISCO,

To be Held in the Mechanics' Institute Pavilion in August, 1865.

The Mechanics' Institute having determined to hold their Fifth Industrial Fair during the coming season, the Executive Committee would respectfully invite all persons desirous of exhibiting Machines, Manufactures, Agricultural Implements, Horticultural Products, Minerals, Ores, and Works of Art, to make application immediately, in order that the proper space may be allotted them.

The Exhibition will be open to the public on Thursday, the 17th day of August, at 10 o'clock A. M.

The general management of the Fair is entrusted to an Executive Committee, consisting of the officers of the Institute.

No contracts or agreements will be recognized unless made by the authorized agents of this Committee.

A competent person will be in attendance at the Pavilion to receive and register all goods designed for exhibition, and will receipt therefor.

Contributions of Machinery and other articles that require long time to prepare for exhibition, will be received from the 15th of July to the 2d of August.

Articles for exhibition that require large space may be entered on or before the 20th day of July, and space will be allotted to the exhibitor on or before the 2d of August.

The Picture Galleries will be ready for the reception of Pictures, Embroideries, Wax and Fancy Work of all kinds, on the 1st of August, when space will be allotted.

The Committee will be prepared for the reception of Fruits, Flowers, Agricultural and Horticultural Productions, and design to have the tables so arranged that the best display possible can be made in this department, and every effort will be made and care taken to preserve their freshness, so that exhibitors may receive full credit for their productions. Those wishing space on these tables should engage it at an early day. There will be space reserved for additions in this department during the Fair.

The several transportation companies, as on former occasions, have, with commendable liberality, consented to transport articles intended exclusively for exhibition free of charge, and Messrs. Wells, Fargo & Co., in like manner, will take charge of them.

The Committee have the fullest confidence that the coming Fair will not only be the most complete and varied in its character, but will also be more attractive than any previous exhibition of this kind on this coast.

No pains or expense will be spared to give the contributors satisfactory opportunities in the spacious pavilion of the Institute for the display of their contributions, and to furnish whatever may be necessary to make the Fair an institution where those who frequent it may be both pleased and instructed.

All articles forwarded should be labeled "For the Industrial Exhibition," San Francisco.

All communications to be addressed to C. S. HIGGINS, Corresponding Secretary.

NOTICE.

The co-partnership heretofore existing between John Youngberg, Stephen H. Covert and William B. Gleason, is hereby dissolved by reason of the said Gleason and Covert having left for the East. This is to notify all persons that I shall pay no debts contracted by the said parties from and after this date. JOHN YOUNGBERG.

San Francisco, May 15th, 1865. 20v10-1m

Our Patent Agency.

The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the PRESS, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

A CARD.

MR. H. S. JACOBS, formerly of this State and Oregon, adopts this method of calling the attention of his old friends and customers to the fact that he has established himself permanently in the city of New York, having, since his residence in California, perfected and secured by letters patent his celebrated WHEEL-MAKING MACHINERY, which not only materially reduces the cost of manufacture, but makes a much more durable and finished wheel than by the old method. These facts are simply attested by the large and increasing demand for Wheels made by this machinery, as well as by the numerous testimonials furnished by parties who have purchased and tested them. Having made large contracts for timber, selected expressly for this purpose by a gentleman who has had an experience of upwards of thirty-five years, and whose entire attention is devoted to the selection of stock connected with this branch of industry, and having had myself an experience of eleven years in manufacturing in California and Oregon, and being personally acquainted with the sizes, styles, material and wants of these States, I feel the most entire confidence in being able to supply the trade with a better and cheaper article than can be had from any other source, and in whatever quantity may be desired, having on hand at present one of the largest and best assorted stocks of Omnibus, Truck, Cart and Light Wagon Wheels, of all sizes, together with a varied assortment of Hubs, Spokes, Felloes, Bent Rims, Shafts, Poles, etc., to be found in the country—all made under my own supervision and of the very best material and workmanship. All descriptions of well-seasoned Timber kept constantly on hand and supplied in any quantity. Orders for material of all and every kind pertaining to Wagon manufacture will be filled promptly for cash on delivery.

Address, THE JACOBS PATENT WHEEL-DRESSING MACHINE AND WHEEL COMPANY, 99 Wall street and 145 and 147 Bank street, New York.

N. B.—Those desiring peculiarity of style in Hubs, Felloes, Spokes, etc., can be accommodated, and will receive our careful attention by sending samples of the same. [20v10

NOTICE TO MINERS.

THE UNDERSIGNED WILL SELL

MINING STOCK

In Incorporated Companies and Unincorporated Mines, in San Francisco District and in El Dorado District, Arizona Territory. It is confidently asserted and believed by most practical miners that Arizona is the richest mining country in the world. Recent developments of these mines are now attracting the attention of capitalists, who have already erected several mills, and more are going there soon. Now is the time to invest to advantage, and obtain the rise that must soon follow. Those wishing to purchase soon can do so, on most liberal terms, by calling on MR. RODNEY CLARK, 338 Montgomery street (room No. 11), San Francisco, or on H. C. SKINNER, San Jose, California.

N. B.—Freight all the way by water at a cost of 4½ cents per pound.

H. C. SKINNER,
San Jose, California.

San Francisco, April 27, 1865. 17q10

1852. 1865.

Thirteenth Year of Publication.

THE GOLDEN ERA.

Founded in 1853.

The oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent, and correspondents of distinguished ability in New York, Paris and London.

Liberal Terms to Clubs.

THE GOLDEN ERA is furnished to CLUBS at the following rates: Three Copies, one year, Ten Dollars; Five Copies, one year, Fifteen Dollars; Ten Copies, one year, Twenty five Dollars. An extra copy will be forwarded, free, for one year, to the person sending a club of 6ve or ten subscribers.

THE GOLDEN ERA is now enlarged by the addition of eight columns to its pages—and presents fifty-six columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected Matter, all combining to render THE GOLDEN ERA a Literary and Family Journal of surpassing interest and attraction; a Welcome Guest in Cottage and Cabin; the favorite at the fireside in City and Country, the most useful, agreeable altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe, and elsewhere. Every Household in the Mountains and Valleys, the Cities, Towns, and Mining Camps of California and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor.

Serial Romances in The Golden Era.

The most popular Novels of the present day published as Serials, from week to week, in the GOLDEN ERA, from advance sheets, simultaneously with their appearance in the English and Atlantic Periodicals.

Among the contributors to the GOLDEN ERA are all the prominent writers of Literary Repute in California and on the Pacific Coast, also correspondents and contributors of distinguished ability in the Atlantic States and Europe, comprising an array of Talent and Genius unapproached by any Literary Journal in California, the Atlantic States, or Europe.

IN THE GOLDEN ERA,

"THE FAIR LILIAS;"

Or, "LIFE IN DEATH,"

A New Story, by PIERCE EGAN, Author of "The Poor Girl," "The Flower of the Flock," "Lady Maud," "The Snake in the Grass," "Such is Life," Etc.

PIERCE EGAN is undoubtedly the most fascinating and attractive Novelist of the age. His stories are eagerly sought for, read and admired by hundreds of thousands in England and America. "THE FAIR LILIAS; or, Life in Death," surpasses, in exciting interest and thrilling situations, all of the productions of the celebrated author, and is Pierce Egan's masterpiece.

THE GREAT SERIAL,

"OUR MUTUAL FRIEND,".....By Charles Dickens.

TO ADVERTISERS.

Best Advertising Medium.—The Golden Era is the oldest Weekly Journal in California, and indispumably enjoys by far the largest circulation in the city of San Francisco and in the interior of the State.

THE GOLDEN ERA

Is universally read in every city, town, village and mining and agricultural precinct in California, and offers unusual and unequalled advantages to those who desire to bring their business prominently before the community. Only a limited space is devoted to advertising. All advertising pages are also largely occupied with fresh and interesting reading matter, and no advertisement can escape attention. The charges for advertising are not so large, proportioned to the benefits derived, as those of other papers. Liberal terms will be made with those who advertise for three or six months, or by the year.

BROOKS & LAWRENCE,
GOLDEN ERA BUILDING,
No. 543 Clay street, near Montgomery, San Francisco.

City Stock Reports---San Francisco Stock and Exchange Board.

From the "Weekly Stock Circular" of the Associated Brokers.

SAN FRANCISCO, SATURDAY MORNING, July 1st, 1865.

The amount of capital offering for loan purposes shows no abatement—amply suppiying the wants of all classes who can furnish the requisite security. A fair demand prevnils in bank circles where the rates ruls as formerly. The outside requirement upon mining stocks and other collaterals is more active, but this description of security being in a little better favor, borrowers are effecting loans with rather more facility than for some tims past.

The receipts of trensure from the interior, since last Saturday, amounted to $1,300,000, making an aggregate of $5,300,000 for ths month of June. The deposits in ths Branch Mint during the past month reached $2,700,000, and our exports of gold and silver amounted to some $2,800,000.

The supply of bullion appsared to be adequate to the requirement of shippers yesterday, and gold bars wsre sold at 825@830. Silver was in fair requsst at ½ ℔ cent. premium to 2 ℔ cent. discount.

Legal Tender Notes have beeu dull and inactive during the week, and the recorded sales at the Board nmounted to less thnn $150,000, (pur value,) advnncing from 72½ to 73¼c., then selling at 73, and closing at about 72¾c. bid.

The mining sharo market has been somewhat apnthetic, and transactions were much lighter than those of last week. Some leading shares were tolerably well maintained, while others show a decline at the close. A few claims, of a rather more speculntive character, were actively dealt in, at enhanced rates. The general market has presented no salient feature this week, and no changes of importance have been reported in the appearance of any portiou of the Comstock vein.

City stocks, for the most part, continue in favor, and are strongly held by many of the leading dealers in these shares. Pacific Insurance Company advanced to $145 per share, (a premium of 45 ℔ cent.) at which rate sales were made. We understand that this company hnve a large surplus on hand. Its affairs are well managed.

California Steam Nnvigation receded from $740 to $710, and closes at about $730 asked. It is believed that this company has nccumulated a surplus balance of some $300,000, after having regularly divided 2 ℔ cent. a month on its capital stock, of $1,000 per share, for more than a year past. Spring Valley Water Company was sold at $483¼, and North Beach and Mission R. R. at $38.

Gold & Curry was sold early in the week at $1,800, nnd is now held at about $1,750. The ores in the upper chambers are said to be holding out well, and the compnny's mill is running up to its full capacity. A dividend of $50 per foot will be paid for the month of June.

Savage is in some favor, and 53 feet were sold, receding from $1,425 to $1,270, seller 30, and $1,325 cash; advancing to $1,400, and closing at $1,425 asked. The deposite of ore recently met with in the lower level has not proven to be as formidable as was anticipated, but it is promising, however.

Yellow Jacket declined from $1,200 to $1,050, rallied to $1,090, receded to $1,065, and sold yesterday at $1,080@1,070. Within this range 160 feet were dealt in. We are not advised of any favorable change in the condition of the Company's finances, or of nny new developments in the mine.

Alpha continues inactive, and 14 feet were sold, declining from $1,450 to 1,300, rallying to $1,400 bid, and closing at $1,450 nsked. Advices from this claim are still favorable, and the liabilities of the company are said to be in process of extinguishment. Some good ore is being taken from the upper levels.

Crown Point has fluctuated but little, and small sales were made, opening at $785, rallying to $800, receding to $770@760, and selling yesterday at $760. The body of ore in the west drift north, (230 feet level,) has improved somewhat, and some good ore is still being taken from the west vein of the upper level.

Belcher receded from $750 to $690, seller 30, and closes nt about $770. No material change has taken place in the upper levels, nnd work progresses with vigor upon the main shaft.

Hale & Norcross has been much less active this week, and some 60 feet were sold, declining from $675 to $500, advancing to $650, and selling at the close at $550@$560. The indications found in the lower drift are thought to be favorable.

Ophir rose to $490, fell to $450, advanced to $500, and was dealt in yesterday at $485@500; some 82 feet changing hnnds. The body of ore in the south mine, between the 6th and 7th galleries, still furnishes about 35 tons daily; one hnlf of which is sent to the Ophir Works, and yields soms $150 per ton; the balance, at the Woodworth Mill, is yielding an average of about $60. The receipts of this company, from the 1st to the 24th ult., amounted to $40,000.

Empire Mill nnd Mining Co. wns sold at $435 per share, but is nnw in some demand at $485. The east drift from the shaft, at a depth of 545 feet, has penetrated n body of fine ore, and the condition of the company is thought to be more flattering than for sometime past. After the payment of a dividend for the month of June, a handsome surplus will remain on hand.

Chollar has been subjected to characteristic fluctuations, and 224 feet were sold, advancing to $375, declining to $305, rallying to $387½, dropping to $340, and closing at $350. An nssessment of $50 ℔ foot was levied on the 28th of June. Potosi has likewise vibrnted materially, declining from $350 to $285, advancing to $375, receding to $335, and selling yesterday at $335@332, some 364 feet in nll changing hnnds. This company levied an assessment of $50 ℔ foot June 27th.

Uncle Sam was sold enrly in the week at $130@135 ℔ share, then suddenly advanced to $200, receded to $165, rallied to $225, and closed at $195@200. A promising body of ore has been found, it is said, in the 6th level, nnd a good deposite of $50 ore was penetrated yesterday in the 3rd level of the Overman ground.

Imperial continues in favor, and 700 shares were sold, steadily advancing from $225 to $241, nnd changing hnnds yesterday nt $235@240. From the nnnual report of th officers of the company, for the fiscal year endiug May 31st last, we gather the following interestiug items:

During the year there was extrncted from the Alta Mine 28,067 tons, the extraction of which has cost, including sinking of shaft, drifting, hoisting waste rock, and improvements at Alta Mine, as follows:

Mining expense	$135,402 66
Mining improvements	1,130 00
Gold Hill Drainage Co	14,378 33
	$150,911 09

Or, $5.37 per ton.

The total dishursements for the fiscal yenr have been $625,191.74. This does not include the debts that were contracted in the previous year, nor the dividends paid. The total number of tons of ore reduced was 28,236—costing an average of $22.14 per ton This includes nll expenses, ordinary and extraordinary, nnd may be safely estimated as a fair average of expenses per ton for the coming year.

The total yield for the year was $854,630.56. Thc number of tons of ore reduced—28,236, making the average yield per ton for the entire year $30.26.

The expense of redncing ores in the Rock Point Mill has been $7,00 per ton, and of trnnsportation of ores to this mill, $4 40 per ton.

The cost of reduction in the Gold Hill Mill has been $10.50 ℔ ton; and of transportation to this mill of ores, $1.00 ℔ ton.

At the date of the last stockholders' meeting, the stock of this company was selling for about $150 ℔ share. During the yenr, $55 ℔ share hns been divided—being something over 3½ per cent. per month for the year.

Bullion has steadily declined from $155 to $140, and is now offered at $145. Sierra Nevada was sold nt $12½, and Wide West nt $7@8.

Burning Moscow has been nctive, and some 1,000 shares were dealt in, declining from $48 to $35, rallying to $45, and selling yesterday at $40@33. The suit of this Company *vs.* the Ophir, is still progressing.

The recorded sales of Stocks and Legal Tender Notes, sincc Saturday last, amounted to $1,000,368.

At the time of our Excursion on the 11th of June, 1865, the Directors have voted to sell

ONE HUNDRED LOTS MORE

At the same price, which is FIVE DOLLARS EACH, and

No Charge for the Deed.

☞ Office Newport Land Company, No. 511 Sacramento street, where plans can be seen and lots selected. 24v10-1m

UNASSESSABLE.

First National
PETROLEUM COMPANY.

Organized under the Laws of the State of California, March, 1865.

CAPITAL STOCK,...$1,000,000,

Divided into 200,000 Shares of $5 Each.

OFFICERS:

HON. J. E. VINTON.....President.
A. W. STRATTON.....Treasurer.
THOS. NEWCOMB.....Secretary.

TRUSTEES:

J. E. VINTON, A. W. STRATTON, M. C. CONROY,
F. M. PIXLEY, W. F. BRANDRETH.

This Company issues none but UNASSESSABLE STOCK. This Company's ground is developed by a special fund, derived from sales from a reserved amount of stock set apart by the Company for such a purpose

This Company has secured SIX HUNDRED AND FORTY ACRES OF LAND, in Tulare county, California, in the midst of one of the most valuable oil regions on the continent. One of the largest flowing oil springs in the State is located upon the ground, over a large extent of which oil may be found by sinking open shafts to the depth of ten or fifteen feet.

The lands were selected by the same parties who assisted in locating the well known "Buena Vista Petroleum Company," which company it adjoins on the south.

One hundred gallons of crude oil have already been received in this city from the Buena Vista Company, upon whose grounds a flowing well has been struck at a depth of fifty feet. This oil may be seen at the laboratory of Prof. E. Benoist, at 643 Third street, San Francisco. From it has been distilled as pure an article of kerosene as can be found in the city, samples of which can be seen at the office of the "FIRST NATIONAL PETROLEUM COMPANY."

DEVELOPMENT.

The Company has already entered into a contract with parties who will start the coming week with suitable tools for developing the property. The Company rests its claim to confidence solely upon the intrinsic value of its property, and feels the utmost assurance that its development will realize their most sanguine expectations, and enable it to take rank, at an early day, as a dividend-paying concern.

We would again call the attention of the public to the fact that when you have purchased stock in this Company there can be no assessments comlog upon you—that no "freezing out" can be attempted by large stockholders upon smaller ones.

THE CONTINGENT FUND,

From which all expenses are paid, is derived from sales of a reserved fund of ten thousand shares of unassessable stock, whose par value is $50,000. The prospectus and map of the Company's location can be had on application to the Secretary, at his office.

Only two thousand shares of the contingent fund is now the only stock in the market for sale, and the proceeds derived therefrom will be appropriated for the purpose designed. The Company are sanguine that they will be able to produce oil in this market from a flowing well upon their claim inside of six weeks, upon which accomplishment there is every reason to believe that the stock will be worth its par value.

San Francisco, April 7, 1865. 14v10

"Say, why should man for thirst be given
If not for wine bestowed by Heaven
To quench such drought as mine?
Without it, I'm a fish on land,
A barren heap of parching sand—
Then give me joyous wine."—*Trinkliel.*

Delicacy of flavor, exhilaration without intoxication, and every other desirable property belonging to the rightly fermented Juice of the Grape, are to be found in the "Gerke Wine," from the celebrated Bosqucjo Vineyard, Tehama county.

There is no wine produced in California that can bear comparison with this, and it would be difficult to find a European wine, of the same class, that can surpass it.

The vintage of 1862 is now offered for sale, in quantities to suit, by the Agent of the vineyard,

A. S. LOWNDES,
Basement of the New York Hotel, southwest corner Battery and Commercial streets, San Francisco. 20v10-qy

☞ For sale by Carriers and Newsdealers.-☜

It is Impossible for editors to know ALL the merits and demerits of their correspondence, consequently the reader must not receive the opinions of our contributors as our own. Intelligent discussion is invited upon all sides and the evidence of any error which may appear will be received in friendship and treated with respect.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Payment in Advance.—This paper will not be sent to subscribers beyond the term paid for. The publishers well know that a good journal cannot be sustained on the credit system.

San Francisco:
Saturday Morning, July 1, 1865.

Removal.

The Office of the MINING AND SCIENTIFIC PRESS has been removed to the old printing stand known as Waters Bros. & Co., southwest corner of Clay and Sansome streets, opposite the Nlantic Hotel (being one block south of our former location), where we may now be found, with more commodious apartments and an extensive JOB PRINTING OFFICE.

San Francisco, April 10th, 1865.

Canvassing Agents.

We would call attention to the following named agents of the MINING AND SCIENTIFIC PRESS as gentleman worthy of the countenance of any community which they may visit, and assistance rendered them in their efforts, by friends and old patrons, or our brethren of the PRESS, will be acknowledged as a personal favor to us:—

Mr. Robert Lattimore—Amador and Alpine counties and the State of Nevada.

Thos. Poyzer, of Grass Valley, for Nevada, Yuba and Sierra counties.

THE IMPERIAL MINING COMPANY.

We have received the Annual Report of the Officers of this Company. The Company is located on Gold Hill, Nevada. According to the report of the President, L. W. Coe, the mines of the Company never looked so well as at the present time, either in the quality of the ore, or the developments of the same with regard to quantity. The Company owns two mills, both of which are in good condition. In the matter of drainage, the facilities are not what they should be; an efficient pump is considered a matter of the first necessity. The legal affairs of the Company are in a highly satisfactory condition. At the date of the last stockholders meeting, the the stock of the Company was sold for $150 per share. During the year $55 per share have been divided—something over 3½ per cent. per month, upon the value of the stock a year ago. The stock is now selling at a large advance. A brief synopsis of the mining and milling operations of the Company will be found in the Stock Circular, which is given in another column. In this connection we would again take occasion to remark upon the important benefits to be derived from such official publications. A full publication of such reports in this paper, would probably be still more beneficial, as they would reach a larger number of readers, be placed more permanently upon record, and at less expense to the Company. Where mining reports are desired in pamphlet form, we are now fully prepared to print them, at the shortest notice, and in the best style, or in any style which may be desired. Reports thus printed at this office will always receive our careful attention in the columns of the MINING AND SCIENTIFIC PRESS. Such favors, moreover, will add largely to the support of the only paper on this Coast especially devoted to the interest of the mines and mining, and enable us to make its columns more valuable to our readers and the interests which we represent.

THE MECHANICS' INSTITUTE EXHIBITION.

The preliminary arrangements for the forthcoming Exhibition of the Mechanics' Institute are rapidly progressing. A very general disposition is manifested, on all sides, to render the exhibition one which shall in every way be worthy of the great interests which are there to be represented—and superior, in all its details, to anything of the kind which has preceded it on this coast. In the departments of machinery and manufactures, we understand the most lively interest is being taken. We trust our mining friends in the interior will see that the mineral display is not forgotton. Those intending to exhibit should make the fact known as soon as possible, in order that the necessary arrangement for room, etc., can be made. There will be no charge for space in the Pavilion. Any of our friends who may desire to forward minerals can send them free of expense to us, addressed to our care, if they wish, and such articles will be kept subject to the order of the senders, or they will be placed in the Pavilion by us, if desired, representing the section or mine from which they were procured. An exhibition of the different varieties of coal, from the various sections of the Pacific coast, would be of special interest. Our oil interests should also be fully represented, by samples of the products of the different wells, both crude and refined; also the tools and other appliances by which the wells are sunk and the oil obtained and prepared for market. We understand that P. Mezzara will exhibit a statue of President Lincoln, made in this State. Arrangements have been made with the Institute under which the proprietors of the MINING AND SCIENTIFC PRESS will issue a daily paper at the Pavilion, during the continuance of the exhibition, in which will appear full and carefully prepared descriptions of the articles exhibited, and such other matters in relation thereto as shall render the same a valuable record and history of the Exhibition of the Mechanics' Institute for 1865.

A NEW WATER FALL.—The Mariposa *Free Press* says that a magnificent water fall, hitherto unnoticed by white men, was discovered on Tuesday of last week, at the point where Mercer Creek empties its waters into the upper San Joaquin, in Mariposa county. The water from the creek, which at present is swollen by melting snows to an immense volume, plunges into the bed of the San Joaquin over a wall of granite upwards of 200 feet in hight. The river itself rushes through a narrow gorge or cleft in the granite, which appears to have been rent asunder by some terrible convulsion of nature. The fall and its surroundings are described by those who have seen them, as rivalling, in wildness and grandeur, the scenery in the Yosemite Valley.

THE LUCKY COMPANY, OF GRASS VALLEY.—We understand that the affairs of this really fortunate Company are still in a most prosperous condition. Their last crushing of fourteen days, with six stamps, yielded $6,000—an average of about $40 per ton. The total expenses of taking out and crushing did not exceed $7 per ton—a profit of $33. How would that read of a Washoe mine? The Company is now putting up steam hoisting works, with which they will commence sinking on incline to test the mine in depth. All the expenses of sinking shafts, running drifts, erecting machinery, etc., is being paid out of the earnings of the Company, in addition to handsome dividends to the stockholders.

TERRIBLE CONFLAGRATION.—Another flourishing mining camp has been reduced to ashes during the past week. Forest City was almost totally destroyed by fire on the afternoon of the 27th instant. One woman perished in the flames, and another was severely burned.

RECENT CALIFORNIA PATENTS.—Among the California Patents recently granted, we notice one to D. W. Hunt, for an improved horse-power; an apparatus for separating and concentrating ores, by Andrew Hunter; and a blow-pipe, by Joshua Hendy—all of this city.

JULIUS ONCE MORE.—We had verily intended never again to have mentioned the name of the Jeremy Diddler, Silversmith, in this paper. And our present purpose is merely to allude to an article which recently appeared in the Pacific *Index*, purporting to be published by him in New York, and which bears the most unmistakable evidence of having been written by the reputed editor of that paper. The vulgarity and profanity of the article is characteristic of the fellow, and carries on its very face the evidence of his mendacity and lack of either honesty or common sense. It is a matter of the utmost surprise to all who knew him in this city that any men of intelligence should presume to place the smallest confidence in such a notorious Jeremy Diddler; and a sore mortification to the citizens of California that such a person should presume to represent, even to a limited extent, their interests in New York. For the California reputation of this fellow we would refer our readers to a paragraph entitled "The Footprints of a Notorious Jeremy Diddler," which was published in the most of the California papers, and copied into the MINING AND SCIENTIFIC PRESS of July 2d, 1864, and to further opinions of the California press, as copied January 28th, 1865. Extra copies of the above papers will be furnished, *gratis*, from this office, to any person who may desire to learn the estimation in which this individual is held in this and the adjoining States and Territories.

THE BELCHER CONSOLIDATION.—The Belcher, Baldwin and Abernethy companies of Washoe have fully consolidated under the title of the Belcher Gold and Silver Mining Company, with a capital stock of $3,120,000, divided into 1,040 shares of $3,000 each. The movement is a sensible one, and cannot fail to meet the approbation of all the shareholders interested. The business of the company can now be done at once, and without the complex triangular system heretofore employed.

SPLICING A WIRE CABLE.—A splice was recently made in the flat wire cable used at the Gould & Curry mine. The splice is twenty feet in length, and is as strong as any other part of the cable. It was made after directions sent from Hallidie's wire-rope manufactory in this city. This is said to be the first splice that has ever been made in one of these patent wire cables outside of the manufactory in which they are.

EUROPEAN ORE SHIPMENTS.—We understand that one House, in this city, has purchased, or made advances upon not less than 3,000 tons of ore, within the last two months, which have been shipped to Swansea. Of this amount about 300 tons was silver ore, about six tons gold ore, worth from five to six hundred dollars per ton, and the balance copper ore. Ore is rapidly becoming an important article of shipment from this city.

CHANGE OF BASE.—The *Evening Bulletin*, of this city, having signally failed in its efforts to write down the rapidly accumulating evidence of the value of the oil deposits in this State, has now changed its base, and employed a new writer upon that subject, with a more correct estimate of our physical resources, to prove that what they have hitherto said on this matter is altogether unreliable.

COPPER ORE.—The whole amount of copper ore shipped from Stockton during the week ending June 17th was 561¾ tons, as follows: Ore from the Union mine, 1,036,890 pounds, shipped by C. T. Meader & Co.; ore from La Victoire mine, 86,848 pounds, shipped by Felix Depas.

THE DANIEL WEBSTER G. and S. M Co., Devil's Gate District, Nevada, elected the following officers on the 28th instant: A. C. Waite, President; Alexander Stott, Secretary; Chas. Stott, E. H. Gates and C. E. B. Howe, Trustees.

KUSTEL'S BOOK, advertised by A. Roman & Co., has already reached a large sale, and should be in the hands of every miner.

A NEW MINING DISTRICT.

Much excitement has been created in Nevada county, in this State, and in Virginia City and vicinity, about the discovery of a rich series of ledges situated in Nevada county, on the Henness Pass route, sixteen miles south from Webber's, and about fifty four miles from Virginia City. According to the *Union*, it is well wooded and watered, a heavy growth of magnificent pine timber covering the entire district, and on a creek close by, affording plenty of water-power. Ten mill-sites are taken up. Robinson & McCarty are now clearing off a site for the erection of a 20-stamp mill, and Capt. Kidd, of Nevada, is preparing for the erection of another. A town has been laid out, and a toll-road located and surveyed from Webber's. There are five lakes within three miles. From its location in the summit of the Sierra, the winters are rather severe, the snow falling to the depth of ten or fifteen feet.

The district has been named "Excelsior," and it is claimed that it will fairly eclipse anything in the shape of croppings yet discovered. The main ledge is traced five miles, for which distance every foot of it is located. The first claim located is the Potosi, of 2,100 feet, after which were located the Eclipse of 1,600 feet, Summit Ruby of 1,400, Virginia of 1,300, and Sherman of 1,600 feet. The whole ledge is taken up by parties from Grass Valley, Nevada and other parts of California, and residents of Virginia City and vicinity. Over sixty persons had arrived there on Thursday, the 22d ult., and most of them men of capital. The excitement is great, and every claim located is being actively worked, all having the greatest confidence in the great wealth of the ledge, which it is supposed will pay from the surface down, for the croppings assay from $9,000 to $61,000 (!) to the ton. The lowest assay yet obtained is $65. The ledge is composed of three different strata of ores-gold, silver and copper; the silver ore being in the center. In the Eclipse claim the stratum of gold ore is four feet in thickness, and the silver and copper strata each three feet thick. The width of the ledge, so far as has been ascertained, the deepest shaft on it being only forty-one feet, is from six to twelve feet wide on top, widening as it goes down. Many people are thronging thither in quest of "rich feet," and Kearsarge is already at a discount.

MORE OF THE GOLD IN THE SACRAMENTO.—We are informed by Mr. Hopkins, (of the NOVELTY amalgamator, instead of the *Little Giant*, as we reported last week) that there is a probability that he will receive such encouragements from capitalists as will induce him to set about a practical test of the sands of the lower Sacramento and American rivers at an early day. Mr. Hopkins is now engaged in testing some quartz sands from the claims of Mr. H. C. Bidwell, of Plumas county. As soon as this engagement is completed he will proceed at once to a thorough examination into the practicability of working the sands of the rivers above mentioned. If his tests prove as valuable as he anticipates, he will order the erection of suitable machinery to work them on a large scale. We shall look with much interest for the result, feeling quite confident that a new and extensive field of enterprise will thereby be opened up.

SAN JOSE TRAVEL.—There is a prospect that the onerous tax on the travel between this city and San Jose will soon be to some extent removed by the establishment of water and horse-railroad communication. A steamer will commence running to Alviso in a few days, which will probably connect with San Jose by stage until such time as a horse-railroad can be constructed, which will doubtless be done as soon as the necessary power can be obtained from the State Legislature.

ALWAYS READY.—A plan has been devised in Marysville for keeping the water in their steam fire engine constantly hot by connecting with it a moveable steam-pipe from the steam boiler at the Water Works.

LITERATURE ON THE PACIFIC COAST.

It is the chief glory of American civilization that opportunities are constantly provided, whereby the mental growth of the community is always made to accompany and keep pace with the material progress of the people. The fact that books are more powerful than bayonets, is fully acknowledged by our nation, and the acts of our Government are shaped accordingly. The printing press is an invariable accompaniment of our armies, and the fact is notoriously established that it has been solely by a suppression and prostitution of the press in the South that rebellion has been enabled to work such dire and terrible destruction in that fair portion of our land during the past four years. While our armies have been able to sweep through and over the rebellious States, bearing down all opposition, they are recognized as but the *pioneers* in the great work of suppressing the rebellion. Steel has met steel, and the northern bayonet has proved superior on the field of strife; but there is yet a still greater work to do before the victory is complete. No carnage, no suffering is to accompany this supplimentary work. It is a work of love—a God-like, a creative work. The press is our heavy arm, while the newspaper and the school book constitute the lighter weapons, with which we are to win over our adversaries, and perpetuate among them the power of a beneficient rule. Already we hear of a gigantic enterprise by which a liberal and enlightened newspaper press is to be established at all the principal business points throughout the South, a large army of schoolmasters and school-mistresses is already upon the ground, and the common school will soon become a universal, as well as the most potent institution throughout that now unhappy region. Who can estimate the influence which these harmonizing and elevating institutions are destined to exert on the masses there, to whom they have heretofore been such utter strangers? The school books which will find their way thither, and the newspapers which will be established there, under the direction of northern sentiment; and teaching, as they all will do, the principles of political and religious liberty, will accomplish more toward the permanent overthrow of the false political and social doctrines which have so long held sway there, than all the grand armies, with banners and bayonets, that have gone down from the North and so gloriously crushed out the most formidable rebellion which the world has ever seen!

Such is the influence of elementary literature, and such is its recognition wherever the Yankee race advances. In planting a new colony on this Pacific slope, the element of popular education has not been forgotten. The spread of knowledge and science—the mental growth of the masses in California—forms one of the chief and most hopeful features of our future growth and prosperity. Nowhere in the history of colonization, or in the advance of nations, have we witnessed such wonderful results. The paths of progress in this direction are thickly planted with monuments which will endure for ages. Look at our wonderful history: Scarcely a decade and a half has passed since one little seven by nine sheet comprised the total of the newspaper literature in California, while the enumeration of English books in the territory now occupied by the State would scarcely have reached three hundred volumes. Then the extent of our educational system was comprised within two or three little mission schools, in which the rudiments of education and religion were taught by pious Catholics to a few friendly Indians! In contrast, what have we seen within the past month? We have seen no less than three graduating classes go forth from as many collegiate institution, crowned with literary honors and fully prepared to take their appropriate places in the world of letters. We have seen honorary degrees, to the highest grade, conferred upon deserving merit, which acts will be fully recognized and duly respected, wherever men has learned to love science, or respect the walks of literature! What do we see now? We behold elegant architectural monuments in San Francisco, and elsewhere throughout the State, devoted to elementary and the higher branches of education, which would do honor to any city in the world. Thousands of the youth and hope of our young and rising State are there receiving a training which is to fit them to go out into the walks of life, to mingle in the busy throng of commercial wants, to occupy high stations in the political world, or shine as stars in the more brilliant walks of literature and art. The three hundred volumes of 1849 have now swelled to an amount not less than *two millions*; while almost every village and town in the State has its public or circulating library. Our newspaper literature will now compare favorably with that of any community on the globe, and numbers one hundred and fifty periodicals, with circulations varying from near ten thousand down to the small but useful circulation of the local papers of the sparsely settled towns of the interior. In this connection we cannot forego a proper allusion to the publishing and book trade of this city, a business which is not only eminently indicative of the literary progress of our State, but which may also be classed as among her important industrial interests. In this respect we are far in advance of any other city in the world, in proportion to our population. We have bookstores in San Francisco which would do credit to the largest cities of the Atlantic States or of Europe. Among the leading firms in this business, we may mention the house of H. H. Bancroft & Co., and A. Roman & Co. The oldest and most extensive of these two houses is that of

H. H. BANCROFT & CO.,

which we will select and more particularly describe as the representative book establishment of the Pacific Coast. This house was established in 1856, and at the first occupied only the room in their present store which fronts on Montgomery street. In two years their business had so much increased as to necessitate the occupation of two additional rooms on Merchant street. Ere another two years had fully elapsed, they were compelled, for want of room, to divide their business, and opened a stationery store on Clay street. Their business still continued to increase, by reason of the literary demands of the community, even more rapidly than the growth of the city. As a consequence they have again been compelled to enlarge, and last spring they succeeded in obtaining a lease, for a term of years, of the entire three-story building owned by Gen. Naglee, the second floor of which was formerly occupied as the U. S. District Court, fronts on Merchant, and connects with the rear of their store on Montgomery street. They have now the most extensive and complete establishment of the kind in the world. The necessity for so large a stock grows out of the peculiarly anomalous condition of the people on this coast. Situated at a distance of many thousands of miles from a market, the dealers in San Francisco cannot, like the dealers in Eastern cities, supply extraordinary orders from neighboring establishments, or manage, by small and frequent purchases, to keep up a full assortment with a limited stock. The full demands of this market can be met only in the manner which Messrs. Bancroft & Co. have initiated, of keeping a constant and full supply of everything which the market demands. This firm is deserving of the highest credit for the energy and enterprise they have thus manifested in placing California on a par with other and older communities in this important particular.

We give, upon the 409th page, a plan of the arrangement of the extensive stock of this firm. The plan, although represented upon a small scale, is, nevertheless, sufficient to give a very good idea of the extent of their stock, and the method and order displayed in its arrangement. System and order, indeed, seems to be a peculiar characteristic of the manner in which the business of this firm is conducted. The upper portion of the diagram represents the ground floor of the establishment, thirty-two feet front, by one hundred and four deep; the lower portion represents the second and third stories, each of which is thirty-two by eighty. All the rooms, with the exception of that fronting upon Montgomery street, which is used as a retail room, are arranged with alcoves, so as to give the greatest possible wall room for the accomodation of the large stock constantly on hand. The shelving is put up eleven tiers high and two feet deep, on which the books are arranged three rows deep, thus forming actually three times the bulk which they appear to assume. A careful examination of the diagram will convey a clearer idea of the variety and arrangement of this immense stock than any word description which we could give.

The second floor of the establishment comprises the large room formerly occupied by the U. S. District Court. The old court room is very properly occupied, one half by law books and the other half by scientific works. This latter speciality comprises the largest collection in the United States, and is divided into seventy-two classes, and so arranged as to render the facilities for their examination by purchasers the most complete possible. There are 16,000 volumes in this department, embracing, among others, works on mining, metallurgy, mineralogy, chemistry, geology, mechanics and machinery, the steam engine, civil engineering, architecture, mathematics, ship building, navigation, naval and military science, manufactures, commerce, natural philosophy, astronomy, geography, botany, agriculture, the British and American encyclopedias, etc., etc. We are now giving, in our advertising columns, a full list, by title, of the works in this department, which will be continued from week to week, until the same is completed. This list will be found very convenient for reference by our readers.

The stock of writing paper at this establishment, which will be found in the third story, comprises, at least, 6,000 reams, and weighs about *thirty tons*. The packages all bear the stamp of Bancroft & Co., to whose order they are especially manufactured.

The following is represented to us as a summary of the stock at present on hand in this establishment: *General Literature*—comprising history, biography, travels, poetry, romance, belles-letters, etc., 40,000 volumes; *School Books*—110,000; *Scientific*—16,000 volumes; *Law*—14,000; *Medical*—4,500 volumes; *Theological*—5,500 volumes; *Juvenile Works*—10,000 volumes; *Envelopes*—1,500,000, varying in size from two inches square to a foot long; *Ink*—20,000 bottles; *Blank Books*—20,000 volumes. The total number of books foots up nearly 200,000 volumes.

Near the rear portion of the ground floor is an office known as the "Subscription Department," which appears to be the heart of the establishment. Here may generally be found Wm. H. Knight, Esq., literally enveloped in maps, manuscripts, minor publications, papers, etc. On our late visit, we found upon his desk the manuscript copy of "Clarke's New School Geography," a publication which Bancroft & Co. is just putting to press in this city. This work has been compiled with especial reference to use in the schools on this coast, and is published under the sanction and with the especial approval of numerous leading men and friends of the cause of education throughout the State. The publication, considering its intricacy and costliness of maps, illustrations, etc., is one of the heaviest yet attempted in this city. It will comprise a quarto of 130 pages, about half of which will be devoted to full and detailed information with regard to the Pacific Coast, with maps and engravings designed especially for it. The maps have been compiled by Mr. Wm. H. Knight, above mentioned, who is also the compiler of Bancroft's Hand Book Almanac for the Pacific States, and several local maps and minor publications, which have been issued by this house. Among the maps which Mr. Knight has recently compiled, we would make special mention of Bancroft's large copper-plate map of the Pacific States. He is now carefully revising it for the third edition, which will contain all the latest discoveries and developments, and the latest political changes of State, Territorial and county lines. This is the most valuable map which has yet been published on this coast, and should have a place in every counting and school room, office and library on the Pacific slope. Messrs. Bancroft & Co. will also publish in a few days a new and elegant official map of San Francisco, four feet by seven in size, which will be carefully and neatly colored. This map will contain all the latest improvements in streets and street nomenclature, and also the water front, as established in 1864 by the Harbor Commissioners, under a legislative act of last session, and which has never before been laid down on any published map.

Most of the publishing that has been done on this coast has been the work of this house. Among the law books that owe their existence to the enterprise of this firm are the California Law and Form Book, which has gone through three editions; Labatt's California Practice Act; Parker's do. (1863); Belknap's Probate Law (1862); Wood's Digest of the Statutes (1860); Halleck's International Law (1861); Labatt's Digest of the Reports, 2 vols. (1862); Congdon's Mining Law (1864-5); a compilation of the General Laws of the State of California, in two large volumes, just published at a cost of $20,000. They also publish Burgess' System of Penmanship, A Handbook of Mining, an Almanac and Official Register, a large copper-plate map of the Pacific States, numerous smaller local maps and a variety of miscellaneous works. Besides their own publications there are not less than 100,000 volumes of Eastern publications now distributed over the coast and bearing the imprint of this firm. One member of the firm resides constantly in the Eastern States, and has connection with all the publishing and importing houses. Bancroft & Co. have dealings with over one hundred Eastern firms.

[Written for the Mining and Scientific Press.]

Letter from Sutter, Amador.

EDITORS PRESS:—I wrote, you last from Jackson, Amador county, from whence I proceeded to Mokelumne Hill, Calaveras. The latter place is situated on a high elevation, and commands a magnificient view of much of the surrounding country. In the distance you see the brick colored earth and fissures running to the tops of the mountains, made by hydraulic mining, which has been carried on extensively at this place for many years past. At the present time the water is low, and a few companies only are at work, though the past season is said to have been unusually good. Leaving Mokelumne Hill, I returned to Volcano, Amador county, which I found to be quite an important village, with an active population, and mining, at present, briskly carried on. The town is situated in a low valley, surrounded by high mountains and, as its name indicates, seems to be the central depression of some great eruption. The busy miners around the base of the mountains, and in the streets, are buring the bed rock to view, and large amounts of gold are shipped below. Three miles west of Volcano, you arrive at Pine Grove. There I had the pleasure of meeting Mr. Purdy and Mr. Thomas Brannan, of the firm of Brannan & Ryder, all of San Francisco, and Dr. Whipple of Pine Grove, partners in the well-known "Tellurium ledge," and known to many of your readers. This ledge is located near Pine Grove, and from Dr. Whipple, Superintendent, I gain the following information:

Length of claim 3,000 feet, with lode twenty-five inches to five feet thick; lower tunnel, 630 feet; upper tunnel, 450 feet long, connecting shaft, 130 feet deep. Engine twenty-five horse power, driving eight 750-pound stamps. The first ore yielded $34.66 per ton. They are now employing twenty hands, and are crushing daily from eighteen to twenty tons. The rock is easily obtained and delivered by the cars at their mill, which is near the mouth of their tunnel.

Within half a mile of the Tellurium, and east of it, is located the San Francisco ledge, which I learn is owned by Messrs. Mitchell & Coe, of San Francisco. Length of claim, 1,800 feet, with a sixteen-stamp mill, driven by steam. The mill is now undergoing repairs, but will be running soon. A short distance beyond is the Serocco ledge, owned by Serocco Bros. and Mr. Porter, which has been worked several years, always paying big dividends. They have a ten-stamp mill, driven by water power; the rock is raised by steam. On the west side of Pine Grove, and near it, are located the Union and Anaconda ledges; the former has been worked several years; the latter has a shaft eighty feet deep, from which they are taking out very rich rock. It is owned by Messrs. Miller, Bradshaw & Jones, of Pine Grove.

On my return I had the pleasure of meeting Dr. Wetzlar, at Jackson, who is one of the owners in the Pandora Gold and Silver Mining Company. The Pandora is located on the Sacramento road, half a mile from Jackson, and is owned by the Doctor, his brother Julius, of Sacramento City, and A. Trenshel, Esq., of Jackson. At a depth of fifty-five feet, the lode is eight feet wide, increasing all the way down. One hundred tons of rock have been taken out and they now propose to put up a twenty-stamp mill. The Pandora is an extension of the celebrated Kennedy ledge, which proved to be exceedingly rich. They had an offer, last week, from an Eastern party to purchase the Pandora, but refused to sell.

In my last I omitted to mention that Mr. Coney, of Jackson, and the Messrs. Bigelow Bros., of San Francisco, were erecting a sixteen stamp steam mill at the Coney ledge, which will be running in a short time; I should have said that 1,700 tons, instead of 170, has been taken from their shaft. I have been around here some three or four days, and will leave for Amador in the morning. At another time I may write farther of this place.

Sutter, June 26th, 1865. L.

THE CLOSE OF THE VOLUME.

The present number closes the tenth volume of the Mining and Scientific Press. If we are to judge of our efforts to render the paper useful by the words of commendation which we have received from our brethren of the interior press, and from many of our correspondents in various directions, we must be satisfied that our labors have not been without avail. We devote a large space in our present issue to a carefully prepared index of the volume just closed, which will prove of great value and convenience to all who file their papers. From an examination of the same, our readers and the public will also be able to form a very good idea of the subject matters treated upon, from week to week, in our columns. We venture to say that it would be difficult to obtain the same amount of valuable information for the same amount of money from any other source. This index, it should be recollected, is for six months only, and the annual subscription of $5 pays for just twice the amount of matter there catalogued. The Mining Shareholders' Directory, which we are still continuing and correcting weekly, is also proving of much value to persons interested in mining stocks. This directory, in connection with our mining summary and stock reports, forms an important feature in our paper, which we have reason to believe is duly appreciated by our readers generally, and will prove of incalculable value for future reference, in bound volumes. The time necessarily devoted to preparing the index must be an excuse for the lack of the usual miscellany with which the paper is generally filled.

Ancient Oil Workings in Pennsylvania.—The existence of petroleum in this country must have been known to a race of people who occupied this continent anterior to the aborigines, found here by Columbus and his followers, and by whom it must have been extensively used. This fact has recently been brought to light by the finding all through the valley of Oil Creek, and other oil localities, of hundreds and thousands of pits, which have evidently been dug for the purpose of gathering this oil, but at a period so remote that trees 250 years of age are found growing upon the earth thrown out of these pits! A very interesting query is suggested as to who were the people who dug these pits, and for what purpose was the oil gathered? They could not have been dug by the present or recent races of Indians who have inhabited that country, for they had neither the means of executing such works, nor had they any use for such quantities of the oil as must evidently have been taken out. These ancient workings must be considered as another link in the great chain of evidence which goes to prove that this continent was once peopled by a race of comparatively civilized people, the very name and existence of which has been forgotten even in the ancient traditions of the aborigines found on this continent by Columbus and his companions.

The New Angular Steamboat Paddle Wheel, the invention of Messrs. Jones and McComb, of this city, will soon be put to a practical test in this harbor on one of the Oakland ferryboats. The wheels are now in process of construction, and the trial trip will probably be made within two weeks. Should this invention succeed as well as anticipated, it must work an important revolution in steamboating.

Just Issued.—We have received a copy of Wheeler & Randall's Quartz Operator's Hand Book, which has just been issued, bearing the imprint of the Mining and Scientific Press. We have already made full allusion to the subject matter and contents of this work. It is for sale by the booksellers generally. Orders may be addressed to this office. Price, by mail, postage paid, $1,25.

The opposition steamer Golden Rule was lost between Greytown and Aspinwall on the 30th of May. All the passengers were saved but most of their baggage was lost.—$2,000,000, in greenbacks were lost with the safe.

THE COMING JUBILEE.

The "Glorious Fourth" will be celebrated the present year with unusual manifestations of joy. We have now to celebrate not only the day on which a great nation was conceived in liberty, and dedicated to the *proposition* that all men are created equal; but we are to meet in the consciousness, and celebrate the *fact* that the events of the last four years have proven, beyond the possibility of a doubt, that we *are* a nation of freemen—whole and entire—and blessed with a Government possessing more of the attributes of power and endurance than any other ever devised by man! Throughout this State the preparations for its observance have been very general. The people of San Francisco intend to make it a day of rejoicing, surpassing any other similar occasion in its history. All the public bodies throughout the city will join in the procession. The Mechanics' Institute, at their meeting on the 23d instant, resolved to participate in the celebration, and, by especial resolution, tendered to the mechanics and workingmen of the city generally a cordial invitation to assemble at the rooms of the Association, on California street, on the morning of the Fourth, and join with them in the procession. A magnificent triumphal arch is now in process of erection at the crossing of Montgomery and California streets, which will far eclipse in splendor anything of the kind hitherto seen on this coast.

Crosby & Thompson's Desulphurizer.—Mr. George W. King arrived in this city on the last steamer, as agent for Crosby & Thompson's Desulphurizer on this coast. One of these machines will arrive in this city on the next steamer, having been purchased by Mr. Buel, a well known Washoe mine superintendent, by whom it will be put up on a mine in which he is interested near Reese River. Mr. King has left in our possession a full set of sectional drawings, with a descriptive account of the invention, which we have not yet had an opportunity to thoroughly examine; but shall endeavor to do so, and report upon the same next week. The process of Crosby & Thompson, it will be recollected, is one to which we alluded at considerable length a few weeks since. It is now in operation in Colorado, where it is said to work most satisfactorily. Several of the machines will be received in this city within the coming month or two, and arrangements will be immediately made for manufacturing them here. Mr. King is now at Virginia City, whither he has gone to take steps to introduce them to the notice of the mill men of that region.

Subsidence of the Earth's Crust.—The commune of Buonanotte, in France, is hourly threatened with utter destruction. Five manufactories have already been overthrown, and sixty-four more are threatened with imminent ruin. The inhabitants have fled in the greatest consternation to the neighboring villages. The cause of the disaster is a sudden and violent depression of the soil, which is at the present time accounted for by one of two reasons—either the fall of an immense mass of earth in the west of the district, or the yielding of the roof of an extensive subterranean cavern. But in reality nothing certain is yet known as to the cause of this most deplorable event. A number of civil engineers have hastened to the spot, and prompt measures are in course of adoption to prevent still greater disaster.

The schooner Isabel has arrived from the Colorado river, laden with copper ore from mines in Arizona Territory, chiefly from the districts around La Paz. The ore, it is said, gives good indications for the mines in that region. The Isabel was sixty days making the voyage from the month of the Colorado, having been detained by calms near the Heads for upwards of two weeks.

To Correspondents.—No. 13 of the "Review of Gold and Silver Extraction" is unavoidably postponed until next week; also, Notes on the Foundries, intended for the present issue. Correspondence from Santa Clara and Santa Cruz next week.

A linseed oil mill is shortly to be built in Santa Cruz County. Our Santa Cruz friends are bound to strike oil, in some way.

A correspondent of the *New England Farmer* thus refers to "bright varnish" as a cure for cuts, wounds, and especially for scratches in horses: "When I worked at my trade in the city, I had occasion to use different kinds of paints and oils; among them was what is called 'bright varnish.' Frequently I would cut myself, sometimes so severely that I have been laid up for weeks. I would try all kinds of salve, but the wound would be a long time healing. One day I cut my hand severely, and, as I had nothing to put on it at hand, I thought I would try some of the varnish, as it is a sticky substance, I thought it might stick the wound together; accordingly I bound up my hand with it, and kept on at my work; the varnish relieved my pain. I had no soreness in the wound, and in one week it was entirely healed. My son was sawing through a board one day, and carelessly put his hand under the board. He had his fore-finger bone entirely sawed off. I put the ends together, put on this varnish, and bound it up. The result was, that after one week the bandage was removed, and the finger had nearly grown together. My horse once had scratches so badly that it was difficult to get him to move about. I rubbed the parts affected with this varnish for two days, which caused a perfect cure. The varnish can be bought at paint shops."

From Arizona.—A letter from Fort Yuma, dated June 4th, contains the announcement of an important discovery of silver ore in the Eureka District, Arizona, near Fort Yuma, and not far from the banks of the Colorado. A gentleman named Spann had sunk a shaft through iron pyrites to the water level and had struck a well defined vein of black silver ore, mixed with streaks as blue as indigo—very rich and free from galena. Several tons would be shipped to San Francisco by the next vessel.

HELMBOLD'S

FLUID EXTRACT BUCHU

For Non-Retention or Incontinence of Urine, Inflammation or Ulceration of the Bladder or Kidneys, Diseases of the Prostrate Gland, Gravel, Brick Dust Deposits, Dropsical Swellings, Orgauic Weakness, Debility, Female Complaints, Etc.

H

HELMBOLD'S

FLUID EXTRACT BUCHU

— AND —

Improved Rose Wash

Will radically exterminate from the system Diseases arising from Habits of Dissipation, *at little expense, little or no change of diet, no inconvenience or exposure*; completely superseding those *unpleasant and dangerous remedies, Copaiba and Mercury*, in curing these diseases.

E

USE HEMBOLD'S

FLUID EXTRACT BUCHU

In all Diseases of the Urinary Organs, whether existing in MALE OR FEMALE, *from whatever cause originating, and no matter of how long standing*. It is pleasant in its taste and odor, IMMEDIATE in action, and more strengthening than any of the preparations of *Bark or Iron*.

Those suffering from *Broken Down or Delicate Constitutions, procure the Remedy at once.*

The reader must be aware that however slight may be the attack of the above diseases, it is certain to affect his *Bodily Health, Mental Powers and Happiness*. If no treatment is submitted to, Consumption or Insanity may ensue.

All the above diseases require the aid of a diuretic.

Hembold's Extract Buchu

IS THE GREAT DIURETIC.

L

HELMBOLD'S

HIGHLY CONCENTRATED

Compound Fluid Extract Sarsaparilla,

For purifying the Blood, removing all diseases arising from excess and imprudence in life, chronic constitutional diseases arising from an impure state of the blood, and the only reliable and effectual known remedy for the cure of Scrofula, Scald Head, Salt Rheum, Pains and Swelling of the Bones, Ulcerations of the Throat and Legs, Blotches, Pimples on the Face, Tetter, Erysipelas, and all scaly eruptions of the skin, and beautifying the COMPLEXION.

M

NOT A FEW

Of the worst disorders that afflict mankind arise from the corruption that accumulates in the Blood. Of all the discoveries that have been made to purge it out, none can equal in effect HELMBOLD'S CONCENTRATED EXTRACT OF SARSAPARILLA. It cleanses and renovates the Blood, instills the vigor of health into the system, and purges out the humors which make disease. It stimulates the healthy functions of the body, and expels the disorders that grow and rankle in the Blood. Such a remedy, that could be relied on, has long been sought for, and now, for the first time, the public have one on which they can depend. Our space here does not admit of certificates to show its effects, but the trial of a single bottle will show to the sick that it has virtues surpassing anything they have ever taken.

B

Two tablespoonsful of the Extract of Sarsaparilla, added to a pint of water, is equal to the Lisbon Diet Drink, and one bottle is equal to a gallon of the Syrup of Sarsaparilla, or the decoction as usually made.

The above Extracts are prepared on purely scientific principles—in *Vacuo*—and embody the full strength of the ingredients entering into their composition. A ready and conclusive test will be a comparison of their medicinal properties with those set forth in the U. S. Dispensatory.

O

HOW TO USE THE REMEDIES.

In Diseases of the Blood, Humors on the Face, or any and every part of the body, use Extract of Sarsaparilla, applying to Pimples and all external Humors or Eruptions the Improved Rose Wash.

Use the Extract Buchu for all diseases requiring the aid of a diuretic, except those of the Urinary Organs, such as Gonorrhœa and Gleet; in these use the Extract Buchu, and inject with the Improved Rose Wash.

L

☞ THESE EXTRACTS HAVE BEEN ADMITTED TO USE IN THE UNITED STATES ARMY, and also are in very general use in all the STATE HOSPITALS AND PUBLIC INSTITUTIONS throughout the land, as well as in private practice, and are considered as invaluable remedies.

Our Circulation.—THE MINING AND SCIENTIFIC PRESS has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than any other paper on this coast.

Plan of the Arrangement of Stock of

H. H. BANCROFT & CO.

Booksellers and Stationers,

SAN FRANCISCO. CAL.

Brandreth's Vegetable Pills.—This medicine, of enduring efficacy, is justly prized as a corrector of all disorders of the stomach and bowels, the common symptoms of which are costiveness, spasms, loss of appetite, sick headache, giddiness, sense of bloating after meals, dizziness of the eyes, drowsiness, and cramping in the stomach and and bowels. These symptoms being suffered to remain, a torpid state of the liver supervenes, and all the horrors of dyspepsia are experienced. Every function of the frame is to a certain extent prostrated; but a little perseverance in the use of BRANDRETH'S PILLS will ever restore the system from this state of misery. Two or three doses will convince the afflicted of their salutary influence. The stomach will speedily regain its strength, a healthy action of the liver will soon take place, and instead of listlessness, heat pain, and jaundiced appearance, activity, strength and renewed health, will be the blessed result. Brandreth's Pills are sold at 25 cents per box, enveloped in full directions. Purchase none unless my private Government Stamp is on the box. See upon it "B. Brandreth" in white letters.

Principal office, Brandreth Building, New York.

U. S. 7-30 LOAN.

By authority of the Secretary of the Treasury, the undersigned has assumed the General Subscription Agency for the sale of United States Treasury Notes, bearing seven and three-tenths per cent. interest per annum, known as the

SEVEN-THIRTY LOAN.

These Notes are issued under date June 15th, 1865, and are payable three years from that time in currency, or are convertible, at the option of the holder, into

U. S. 5-20 Six Per Cent.

GOLD BEARING BONDS.

These Bonds are now worth a premium of nine per cent. including gold interest from November, which makes the actual profit on the 7-30 loan, at current rates, including interest, about ten per cent. per annum, besides its EXEMPTION FROM STATE AND MUNICIPAL TAXATION, WHICH AMNS FROM ONE TO THREE PER CENT. MORE, according to the rate levied on other property. The interest is payable in currency, semi-annually, by coupons attached to each note, which may be cut off and sold to any bank or banker.

The interest amounts to

One cent per day on a $50 note,
Two cents per day on a $100 note,
Ten cents per day on a $500 note,
Twenty cents per day on a $1,000 note,
One dollar per day on a $5,000 note.

Notes of all the denominations named will be promptly furnished upon receipt of subscription. This is

The only Loan in Market

now offered by the Government, and it is confidently expected that its superior advantages will make it

THE GREAT POPULAR LOAN OF THE PEOPLE.

Less than $300,000,000 of the loan authorized by the last Congress is now on the market.

This amount, at the rate at which it is being absorbed, will all be subscribed for within four months, when the notes will undoubtedly command a premium, as has uniformly been the case on closing the subscriptions to other Loans.

In order that citizens of every town and section of the country may be afforded facilities for taking the Loan, the National Bank, State Banks, and Private Bankers throughout the country have generally agreed to receive subscriptions at par. Subscribers will select their own agents, in whom they have confidence, and who only are to be responsible for the delivery of the notes for which they receive orders.

JAY COOKE,

Subscription Agent, Philadelphia.

March 25, 1865. 17v10 3m

ADDENDUM.

PER GYPSLAND TELEGRAPH: PHILADELPHIA, May 17, 1865

Second Series all sold. Commenced on Third Series. Two Hundred and Thirty Millions (230,000,000) precisely like other two Series, except dated 15th July, and Government reserves the right to pay six per cent. in Gold instead of 7-30 Currency.

JAY COOKE,

Subscription Agent, Philadelphia.

Ward's Perfect Fitting Shirts.

These Shirts are too well known to need any comment, both for perfect fit and quality. A large supply always on hand. Also, the largest stock of Gents' Fine Furnishing Goods on the Pacific Coast. Try one of his Shirts, and you will never wear any others.

S. W. H. WARD & SON,

No. 323 Montgomery Street.

(Odd Fellows' Hall).

New York House, 337 Broadway. 10v10

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

THE Solano *Press* asserts that Suisun has the finest marble quarry in this State. It is not worked.

A POPULOUS suburb of Melbourne, Australia, has been discovered to have been built on a mine of gold, and drifts are being run under the town for the purpose of working it out.

LINCOLN AN INVENTOR.—A model of a steamboat, so constructed as to be easily raised above shoals, has been on exhibition in the Patent Office at Washington since 1849. The inventor's name is attached to the model on the check-card—"Abraham Lincoln."

THE materials for a large cotton press and storehouse have been landed at Riucon Point, for erection at the Potrero. The cotton supply is to be obtained in Western Mexico, and ultimately in Southern California and Tulare Valley.

SEVERAL of the leading mines at Virginia City and Gold Hill have determined to close work on the Sabbath, thus allowing their operatives a day of rest from their labors—an example worthy of all imitation.

THE BEST BOOK

—FOR—

MINERS, PROSPECTORS AND MILLMEN.

Nevada & California Processes

—OF—

SILVER AND GOLD

EXTRACTION,

For General Use,

BY GIUDO KÜSTEL,

Mining Engineer and Metallurgist—Formerly of the Ophir Works,

IN ONE HANDSOME OCTAVO VOLUME.

SYNOPSIS OF THE WORK.

PART FIRST.

Chapter 1st—Treats of the methods of recognizing silver and gold ores, and contains a "Systematic Proceeding" for their determination by blowpipe analysis readily learned and practised, and is a reliable and accurate guide.

Chapter 2d—Is a description of gold and silver ores, describing many interesting occurrences in minerals belonging to the Comstock, Gold Hill, Humboldt, and Arizona Mining Districts.

Chapter 3d—Describes the requisites and approved methods for testing and assaying—with Illustrations.

Chapter 4th—Speaks chiefly of the extraction of gold, especially the amalgamation treatment of ores in batteries, pans and arrastras: and also the extraction of gold by chlorination.

Chapter 5th—Is replete with valuable information on the extraction of silver, including divisions of processes employed. The behavior of chemicals by the wet process; the same when calcined—with valuable hints to attendants roasting ores. Full description for the cold and melting processes, etc.

Chapter 6th—Makes mention of the most modern utensils and machinery, such as pans, agitators, furnaces, etc., with comprehensive diagrams.

PART SECOND.

ON GENERAL METALLURGY.

Chapter 1st—Treats of many species of argentiferous ores; the dry assays of rich and poor ores; also, the same by the humid and dry methods.

Chapter 2d—Presents a clear and comprehensive description of the extraction of silver either by melting or amalgamating process—its dissolution and final precipitation—with divisions of the principal modes of extraction employed.

Chapter 3d—This last chapter gives full and precise formulas for the extraction of the metals in the dry way; the various modes employed in Europe and South America.

The "Amalgamation in pans" with chemicals, or dry method by calcination or roasting ores, forms the most valuable portion of the work; the same being thoroughly and distinctly described and explained, and particularly designed for the treatment of ores in Lower California, Arizona, Mexico, and other mining districts where argentiferous lead ores abound. No less valuable and important are the practical descriptions and illustrations of cupellation and refining of silver, and concentration of the same in lead, by the Patillson and other processes.

This Work is invaluable to Prospectors, Miners, Metallurgists and Mill-men throughout the Pacific States, containing valuable formulas for the treatment of ores and minerals, expressly prepared in an authentic manner and a plainly written style, for persons engaged in mills in California, Washoe, Lower California, etc. It is also valuable to prospectors and miners unacquainted with mineralogy, having a full and clear chapter on Blowpipe Assays and Tests.

Practical Mining School,

Bryant Street, Between Third and Fourth,

SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

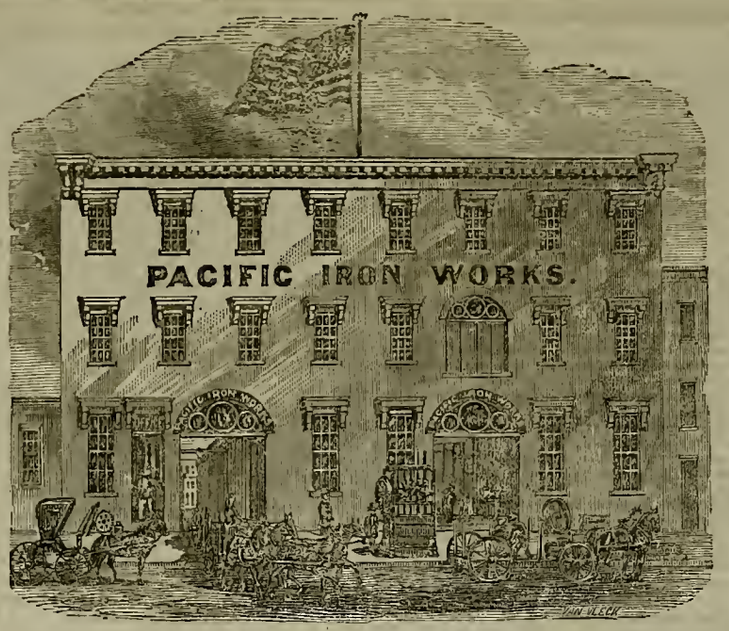
SAVE YOUR BOILERS AND FUEL.

One-eighth of an inch of deposit on the fire surface of a boiler takes THIRTY PER CENT. of the steam generating power from that boiler, and, of course, wastes thirty per cent. of the fuel; and, what is a greater misfortune, it keeps the water from the plates and flues, causing them to scorch, blister and burn, destroying the boiler, and too often human lives.

I Have a Compound For Sale



That I have used with complete success in every instance, and without delaying the running of machinery, or injuring the boilers in any manner, and at a cost of five dollars the boilers can be made as clean as when they were new.

Superior for working either Gold or Silver Ores.

Genuine White Iron Stamp Shoes and Dies.

Having been engaged for the past eight years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 15v10qy-tf

HANSCOM'S CRUSHERS,

Made in sizes suitable for Breaking Quartz for Batteries; Rock for macadamizing or concrete; Copper Ore for sacking, sampling, or concentrating; also, for crushing Quartz for Arastras and Grinders. The small sizes make a most efficient Crusher for Prospectors, and are arranged to be run by Hand, Horse, Water, or Steam Power. For further information address W. W. HANSCOM.

1 Golden State Iron Works, San Francisco.

HUNT'S PATENT
Circular Sweep Horse-Powers,

For running Churns, Washing Machines, Grindstones, pumping water, sawing wood, and other light machinery. Price, $100, at the Factory.

HUNT'S PATENT SELF-REGULATING TREAD HORSE-POWER is superior to any machine of the kind in the market. Price, with Governor, all complete to set to work, at the Factory, $300. Manufactured by

E. O. HUNT,
17v10 28 Second street, San Francisco.

THE HAMMER QUARTZ MILL.

[PATENT APPLIED FOR.]

This Machine is now complete and ready for sale. In constructing it, our aim has been to produce a light, cheap and economical Crusher—one adapted to mining on a small as well as on a large scale.

The elementary principle on which it operates is that of the stamp—the only one really reliable and economical.

But the stamp has many serious disadvantages, among which are its great weight and small velocity; the great power required to run it; difficulty in feeding properly; imperfect discharge, and the necessity of crushing wet, or the annoyance from dust in crushing dry.

All these difficulties are obviated in our machine, and the percussive blow of the stamp retained, with the further advantage of its being a drawing or grinding one.

We give to our hammers such absolute or relative weight and velocity as we choose—just such as to effect their purpose and no more—thus securing the qualities of the natural hammer blow.

The feed is self-adjusting and uniform, and as fast as the ore reaches the required degree of fineness (which depends upon the fineness of the screen or sieve used), it is instantly discharged, so that there is no packing of the ore under the hammers.

The mill crushes dry, with no more dust than that incident to feeding, which is trifling.

As the only support of the mortar is a single post set into the ground, the machine can be put in place at slight expense.

The size now being built weighs about 1,500 pounds complete; the heaviest piece not weighing over 275 pounds. It is driven by half a horse-power, and crushes from three to ten tons per day of twenty-four hours per day, according to the character of the rock and the fineness to which it is reduced.

PRICE,.....$800.

Larger ones will be furnished if desired.

We invite an inspection of the Mill now in operation adjoining the Foundry of DEVOE, DINSMORE & CO., on Fremont street, between Market and Mission, San Francisco.

Office, No. 11 Court Block, San Francisco, Cal.

21v10 **RIX & LOGAN.**

ATWOOD'S
Self-Regulating Windmill.

Rear view of one fan.

This Windmill is the most perfect self-regulator yet invented, and is capable of being adjusted to any desired speed. Manufactured at

222 Mission Street, North side, below Beale,
SAN FRANCISCO.

N. B.—We also manufacture DICKERSON'S SELF-REGULATING MILLS; also, Rotary and Stationary Mills of different styles and prices, varying from $50 to $500 each; also round and square Water Tanks made to order.

222 Mission street, below Beale. 5

HUNT'S
IMPROVED WIND-MILL.

THIS WIND-MILL IS RAPIDLY taking the place of all other Mills on the Pacific Coast. These Mills are so simple in their construction, that when once built, they can be put in order by almost any person; and when once in order they will run for years without repairs.

Prices, from $50 to $1,000.

ROUND AND SQUARE WATER TANKS BUILT TO ORDER.

HUNT'S PUMPS

Are admitted to be the best in the Market for Wind Mills, being built expressly for that purpose. They can be set, and taken apart with a common wrench, and are very easily repaired.

HUNT'S ENDLESS CHAIN
HORSE POWER
For Sawing Wood.

ALSO, THE

Self-Regulating Horse Power

Is so arranged as to give a steady motion, and is calculated to be used for turning Wood, Iron or Brass, also for Scroll or Circular Sawing, and is fully equal to Steam for any light work. The above Machines are built of the best materials, and made as Durable as Wood and Iron will make them.

ALL WORK WARRANTED.

☞ For further Particulars see small circulars. ☜

No. 28 Second Street, and 108 & 112 Jessie Street, San Francisco. 26-3m

PETROLEUM OIL WELLS.

HENRY STEELE,
MANUFACTURER OF ALL SIZES OF
Tools for Well Boring.

Having had long experience in this line, I am prepared to fill orders promptly and at low rates. No. 107 Leidesdorff street, between California and Sacramento, San Francisco.
21v10-1m

SALMON'S
PROPELLER AMALGAMATOR.

The proprietors and inventors of this machine, after fourteen years of practical experience in mining in California and Nevada Territory, and having a thorough knowledge of the wants of Miners and Mill men, have succeeded in making an Amalgamator, which, for the purposes intended, far surpasses any other yet presented to the public, and which can be furnished at less than one-half of the expense of any other Amalgamator, now in use, besides requiring less labor to clean and keep it in running order. The Amalgamator is simple in its construction, consisting of a pan or tub constructed of wood and adapted to either a Stone or Iron bottom. Opposite each other, and on the inside of the tub, are two flanges, from two to four inches broad, reaching from the top to near the bottom, with room for the mullers to pass under. These flanges are for the purpose of preventing the pulp from forming a circular current, and together with a number of wings placed like a screw propeller on the muller-shaft, force a current continually on the quicksilver at the bottom and under the grinding surface of the mullers. This peculiarity of propeller-screw and side wings, in combination with a deep tub, are what the proprietors claim as new and for which a patent has been applied for. The undersigned are now manufacturing three different sizes of this machine, and the attention of the public is respectfully called to the following results obtained, from the working of Reese River rock, by this amalgamator, and assayed by Miller & Lunbaum, at Austin, Nevada:

	No.	Fine		No.	Fine
Assay	250	943	Assay	300	990
Assay	285	941	Assay for Czotman		930
Assay	286	940	Assay Water Rock		966
Assay	291	950	Assay Water Rock		998
Assay			St. Helena Ledge, W. D.		966

These, including a hundred other batches, were all worked to within fifteen per cent., and some to within ten per cent., of the assay. Parties interested will find it to their advantage to call and see the above machine in operation.

Manufactured at the San Francisco Foundry, San Francisco, California, by

J. & W. C. SALMON,

To whom all orders should be addressed. 15

TO QUARTZ MINERS.

Hinkle's Centrifugal Pulverizer and Amalgamator!

THE ATTENTION OF MINERS IS RESPECTFULLY requested to HINKLE'S CENTRIFUGAL PULVERIZER AND AMALGAMATOR, now manufactured and to be seen in operation at the NOVELTY IRON WORKS of Mr. E. T. Steen, Nos. 37 & 39 Fremont street, between Market and Mission streets.

This machine is the best in the State for the purpose of Pulverizing and Amalgamating ORES. The whole machine, made entirely of Iron, will not exceed One Ton, and no piece of it will exceed 200 pounds, which makes it very convenient for transportation to remote districts. It will work Two Tons of Rock per day.

Mr. Hanson, who is running one of the machines, is an experienced Amalgamator, and will receive Ores at the above named place, and extract the metals and furnish assays for all persons wishing the same. The Subscriber manufactures a HAND MACHINE for Miners engaged in prospecting, which will work 60 pounds of ROCK at a time, and which will weigh about 175 pounds.

The Pulverizer and Amalgamator works Rock of the size of a grain of corn to an impalpable powder. Apply to

PHILIP HINKLE,

At the Novelty Iron Works, Nos. 37 & 39 Fremont street. 15-1m

BAUX & GUIOD'S
Separator & Amalgamator

Is the most important improvement in mining machinery ever introduced. It was awarded the FIRST PREMIUM at the San Francisco Mechanics' Fair for 1864, where it proved itself to be the best Separator and Amalgamator among all the competitors. Constructed on principles which combine SCIENTIFIC KNOWLEDGE WITH PRACTICAL EXPERIENCE, these Pans extract more gold and silver from their ores than any others in use, as a few hours trial will demonstrate. Mill men will find it to their advantage to employ these pans as Separators, in addition to the ordinary Amalgators now in use, and to re-work their old tailings.

The cost of these pans is inconsiderable, and their structure is such that they can be readily separated in parts convenient for packing on mules. Among the many advantages possessed by BAUX & GUIOD'S Pan, are the following: The trifling cost for attendance; Its small cost; Its portability; The large quantity of pulp it can operate upon in a given time; It may be worked even weeks without stopping, as it is constructed to work continuously; The complete thoroughness of the separation of the rock from the metals and the trifling power required to work them; They can be attached to any ordinary crushing apparatus.

Lapidaries' refuse, Refiners' ashes, Jewelers' sweepings, purchased or worked for a percentage. Ores and tailings worked or assayed at reasonable rates.

For further particulars, or to see this Pan in operation, call on or address

J. B. BAUX,

Fremont Street, near Mission, adjoining the San Francisco Iron Works, San Francisco. 4v8

FARRAND'S
Oscillating Amalgamator,

RECEIVED THE
ONLY PREMIUM
AWARDED FOR AMALGAMATORS
At the Recent Industrial Fair
OF THE
Mechanics' Institute of San Francisco,

Committee of Awards.

O. BELDEN,	W. T. GARRATT,	H. P. WAKELEE,
O. GORI,	GEO. JOHNSON,	C. M. RADCLIFF.

This Premium Amalgamator was placed on trial, at the Mechanics' Pavilion, with the Varney, Wheeler & Randall, and Hepburn & Peterson Pan, each working eight hundred pounds of crushed rock.

This Unrivaled Amalgamator possesses many advantages over all others now in use.

1st. It is capable of doing double the amount of work of the ordinary Pans, at a saving of more than one-half of the power.

2d. It reduces the pulp finer, thereby producing a better result.

3d. It requires less quicksilver by one-half at a charge, whilst the loss by trituration is comparatively nothing.

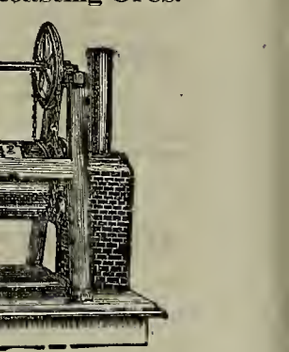
4th. As an Amalgamator of gold contained in sulphurets as also for very fine or flour gold, it has no equal.

5th. This Amalgamator involves no complicated machinery, and is less liable to get out of order than any of the pans.

Manufactured at the MINERS' FOUNDRY.

W. D. FARRAND, Inventor,
R. L. OGDEN, Agent, SAN FRANCISCO.
S. E. corner Montgomery and California streets.
19v9

NOTICE TO MINERS.
NEW QUARTZ MILL.



THE ATTENTION OF ALL ENGAGED IN MINING IS called to Fauchery's unrivaled Mining Machines, consisting of his celebrated Turbine Water Wheel, which took the First Premium at the Mechanics' Fair at San Francisco for 1864; his Crocodile Quartz Crusher; his Pulverizer; and his Improved Proficere Amalgamating Barrel; altogether forming the most complete and effective Quartz Reducing and Amalgamating Mill now in use. This mill can be put up at less cost, run with less power, and accomplish more work, than any other now in use.

B. Fauchery and F. Genard

Having established a Quartz Mill and Metallurgical Works, are now prepared to crush, roast, amalgamate, assort, cupellate, and give correct analysis of ores. We are also prepared to give our attention to the building and constructing of Quartz Mills and Furnaces, and give directions for working Mines; and also to instruct persons in all branches appertaining to Mining Works, at No. 23 Fremont street, near Market, Railroad Foundry building.

F. GENARD, **B. FAUCHERY,**
Metallurgist. **Engineer,**
24v9

WM. BRUCKNER'S
Furnace for Roasting Ores.

Now in Operation at 416 Market street.

This Furnace, which is portable, and can be carried on muleback, undertakes to roast without employing any labor whatever for the operation of stirring, which is accomplished by machinery that may be driven by steam or any other motor. It consists of an iron cylinder, which, being suspended by chains, in rotating mixes and stirs the ore, by an internal apparatus, quicker and more perfectly than can be done in any other furnace hitherto known in metallurgy. It can be applied to any kind of ore, and the rapidity and perfectedness of its operation, the great saving in fuel, and the entire saving of the labor usually required for stirring the ore, together with the small cost of constructing it, renders this furnace a most

Economical and Practical Invention.

The Furnace may be had of two sizes—one being nine feet in length and holding fourteen hundred pounds, and the other six feet in length, and holding eight hundred pounds. One horse power is required to drive the machinery of the larger sized furnace, and three-fourths of a horse power for the smaller size. Parties wishing to erect such furnaces will please communicate to

W. BRUCKNER,

5v10 No. 416 Market street, San Francisco.

BLAKE'S
QUARTZ BREAKER

Is now extensively used for breaking hard masses of

Quartz or Ores

To a size suitable for stamps. These machines are patented, and are in practical operation in

CALIFORNIA, AUSTRALIA,
WASHOE,
ENGLAND, FRANCE,
—AND—
THE ATLANTIC STATES.

These Machines, or circulars containing further information regarding them, may be obtained of the undersigned. Address,

BLAKE & TYLER,

Box 2077 San Francisco Post Office.

CHAS. T. BLAKE,	E. TYLER,	WM. P. BLAKE,
Idaho City.	Michigan Bluff.	San Francisco.

4v10

VARNEY'S
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the **PACIFIC FOUNDRY,**

1v10 San Francisco.

Hepburn & Peterson's
AMALGAMATOR.

THE SUBSCRIBERS WOULD CALL THE ATTENTION of the Mining Public to their Reducer and Amalgamator, and also to their Separator for reducing and separating the mineral from

Gold and Silver Ores,

Manufactured and exhibited at the Vulcan Iron Works, Nos 137 and 139 First street, San Francisco.

These machines secure to the Miner a more Expeditious and Perfect Reduction and Amalgamation, a less liability to accident and delay, and a greater amount of useful effect in proportion to the power employed to keep them in operation than any other machine now in use for producing similar results. This fact is attested to by their general adoption and preference at all the principal Reduction Works in Nevada Territory; among which may be mentioned the Gould & Curry Mill, the Silver State Reduction Works, Zephyr Flat Mill, Pioneer Mill, Eastern Slope Mill, Phœnix Mill, etc.

☞ This Amalgamator may be seen in operation at the European Metallurgical Works, Bryant st. bet. 3d and 4th.

[Illustrated in the Mining and Scientific Press, April 9th, 1864.]

FOR SALE BY

S. F. BUTTERWORTH,

Northwest cor. Battery and California sts.

v9-19 SAN FRANCISCO.

NOTICE OF APPLICATION OF MARRIED WOMAN TO become a Sole Trader.—Notice is hereby given, that JANE C. SMITH, of the city and county of San Francisco, intends to make an application to the District Court of the Fifteenth Judicial District of the State of California, in and for the city and county of San Francisco, on the twenty-ninth day of July, A. D. 1865, for an order of said Court, permitting her to carry on business in her own name and on her own account, pursuant to an act of the Legislature of the State of California, passed April 12th, 1852, entitled "An Act to authorize married women to transact business in their ownname," and of the Act amendatory and supplementary thereto, passed April 18th, 1862. The business she intends to carry on is that of the purchase and sale, leasing and mortgaging of real estate, the cultivation of lands, and all matters therewith, or with either of them connected, and of a general trader, in the city and county of San Francisco and the county of Contra Costa.

JANE C. SMITH.

June 29th, 1865. jy1-4w

W. FELL, Secretary.

je10 Office, No. 53 Montgomery Block, San Francisco.

POSTPONEMENT.—The above sale is hereby postponed until Thureday, July 6th, 1865, at the same hour and place. By order of the Board of Trustees.

je24 W. FELL, Secretary.

Caledonia Tunnel and Mining Company, Gold Hill District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 9th day of June, 1865, an assessment of three dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, No. 10 Government House, corner of Washington and Sansome streets, San Francisco or to Jamee V. Coffey, Virginia, Nevada.

Any stock upon which said assessment shall remain unpaid on Saturday, the 15th day of July, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, July 29th, 1865, at 12 o'clock M., to pay the delinquent assessment, together with costs of advertising and expenses of the sale. By order of the Board of Trustees.

je10 J. M. BUFFINGTON, Secretary.

El Dorado Gold and Silver Mining Company, Silver Mountain District, Alpine county, California.

ASSESSMENT No. 5.—Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 5th day of June, 1865, an assessment of one dollar per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company.

Any stock upon which said assessment shall remain unpaid on Saturday, the 15th day of July, 1865, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Monday, the 31st day of July, 1865, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. WARREN CLARK, Secretary.

W. D. ROOT, Deputy Secretary.

Office, No. 410 Montgomery street, San Francisco.

NOTICE.—At the above meeting, assessment No. 1, levied July 8th, 1863, assessment No. 2, levied August 4th, 1863, and assessment No. 3, levied October 15th, 1863, of ten cents per share each; also, assessment No. 4, levied September 24th, 1864, of fifty cents per share, were rescinded, and stockholders having paid said assessments will be credited on the above assessment, No. 5, accordingly. Also, notice is given, that the additional amount of twenty cents per share (being properly assessment No. 5), was levied for the month of June, 1865.

J. WARREN CLARK, Secretary.

je10 W. D. ROOT, Deputy Secretary

Office, northwest corner Washington and Sansome streets.

San Francisco, June 12, 1865. je17

Economy in Advertising.—The MINING AND SCIENTIFIC PRESS is the best and most ECONOMICAL mining advertising medium in this city. Our terms are less than ONE HALF the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

QUARTZ OPERATOR'S HAND BOOK.

By ZENAS WHEELER and P. M. RANDALL,

AUTHORS AND PUBLISHERS. 12-mo, 144 pp., IN CLOTH.

THE QUARTZ OPERATOR'S HAND BOOK is presented to the public as a carefully prepared epitome of all that is valuable for the practical operator in the mine and mill. We have here all the most necessary hints and directions for testing and assaying the ores of the various minerals; an explanation of chemical terms; a brief and intelligible description of the numerous processes for roasting ores and the extraction of metals from their ores by amalgamation and otherwise.

The work also contains an original and highly interesting discussion of the tractory and differently formed grinding plates, as applied to the reduction of ores—a subject not only of special interest to the scientific reader, but also practically of the highest importance to every quartz miner.

Professor Silliman, of Yale, and Hodgson of the College of California, having examined this discussion, as submitted to them by its author, Mr. Randall, previous to the compilation of this work, speak of the same as not only mathematically correct, but also as of great practical value. Messrs. W. R. Eckart, Jr., Engineer, (late of U. S. N.,) and W. M. Belshaw, assayer and superintendent of the S. T. M. Co., to whom the entire work was submitted while passing through the press, speak of the same as one of high practical importance to quartz miners and millmen generally.

No work has been offered to the mining public of California which contains so much valuable information, condensed into so convenient a space as is here presented. In its preparation, much care has been taken to secure brevity, conciseness, and simplicity—in fact to make it a complete and reliable QUARTZ MINER'S HAND BOOK.

THE TABLE OF CONTENTS:

Assay, ... 12
Assay Blowpipe, ... 4
Assay of Copper—dry way, ... 14–15

THE

Mining and Scientific Press,

PUBLISHED EVERY SATURDAY BY

DEWEY & CO.

PATENT AGENTS,

No. 505 Clay Street, corner of Sansome,

SAN FRANCISCO.

Each number of the PRESS contains *sixteen pages* of *sixty-four columns*, (size of Harper's Weekly,) embracing a variety of reading of direct value to the progressive citizens of the Pacific Coast. Our columns contain a liberal discussion of the different methods of

SAVING GOLD,

All new discoveries in the treatment and development of precious ores and metals, and illustrations of new machinery and inventions Commencement of Eleventh Volume, July 8th, 1865.

TERMS, IN ADVANCE.—One year, $5; six months, $3. Back volumes, to January 1, 1864, furnished at $3 per volume.

OUR PATENT AGENCY

Is conducted in a competent, thorough, reliable and strictly confidential manner. Inventors on this coast having their applications for patents made out through our Agency, can sign their papers at once and thus secure their rights at least three months earlier than by trusting the same to distant agencies, situated in New York or Washington.

Job Printing.

We have a large and well established Office for BOOK AND JOB PRINTING—in Plain, Fancy and Ornamental Style. Especial attention given to all work for Mining Companies and managers.

Prices Low.

THE

WHEELER & RANDALL

Grinder and Amalgamator.

In the engraving on the opposite page, A represents the Rim of the Pan; B, Cross Frame; C, Legs; D, Gear; G, Driving Pulley; H, Muller; I, Driver; K, Dies; L, Shoes; M, Hand Wheel; N, Jam Nut, and O, Wings or Guide Plates.

The attention of the Public is respectfully called to these facts:

1st. That the Mechanical work accomplished by differently formed grinding plates, having the same diameter, weight, hardness, and revolving at the same velocity, is as follows, to wit:

The Mechanical Work of plane, circular plates of the usual ring form, is ninety-eight 98

The Mechanical work of conical plates of the most approved form, is one hundred and ten 110

The Mechanical work of Tractory-formed plates, as introduced in the invention of Wheeler & Randall, is one hundred and seventy-seven 177

That is, the Tractory-formed grinding plates will reduce one hundred and seventy-seven tons of ore, the conical grinding plates one hundred and ten tons, and the plane circular grinding plates ninety-eight tons, to the same degree of fineness in the same time. Those using this invention certify that they thoroughly reduce five tons of ore, as it ordinarily comes from the wet battery, per day in each pan, four feet diameter, the muller making sixty-five revolutions per minute.

2d. That as a whole, the Wheeler & Randall Grinder and Amalgamator is one of the most simple, compact, substantial, convenient and efficient pans in use.

THE EXCELSIOR

GRINDER AND AMALGAMATOR.

In the engraving on the opposite page, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; *a*, Dies; *c*, Shoes, and o, Openings,

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan *when properly constructed*, are respectively 177, 98 and 110.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity, "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan ninety-eight tons, and the Conical Pan one hundred and ten tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes *direct* from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been burnished. It is truthfully said "that the Tractory-formed Pan as a Grinder has no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works,

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

WHEELER & RANDALL.

SAN FRANCISCO, June 13, 1865.

Index to Volume X,

—OF THE—

Mining & Scientific Press.
